PROJECT OVERVIEW

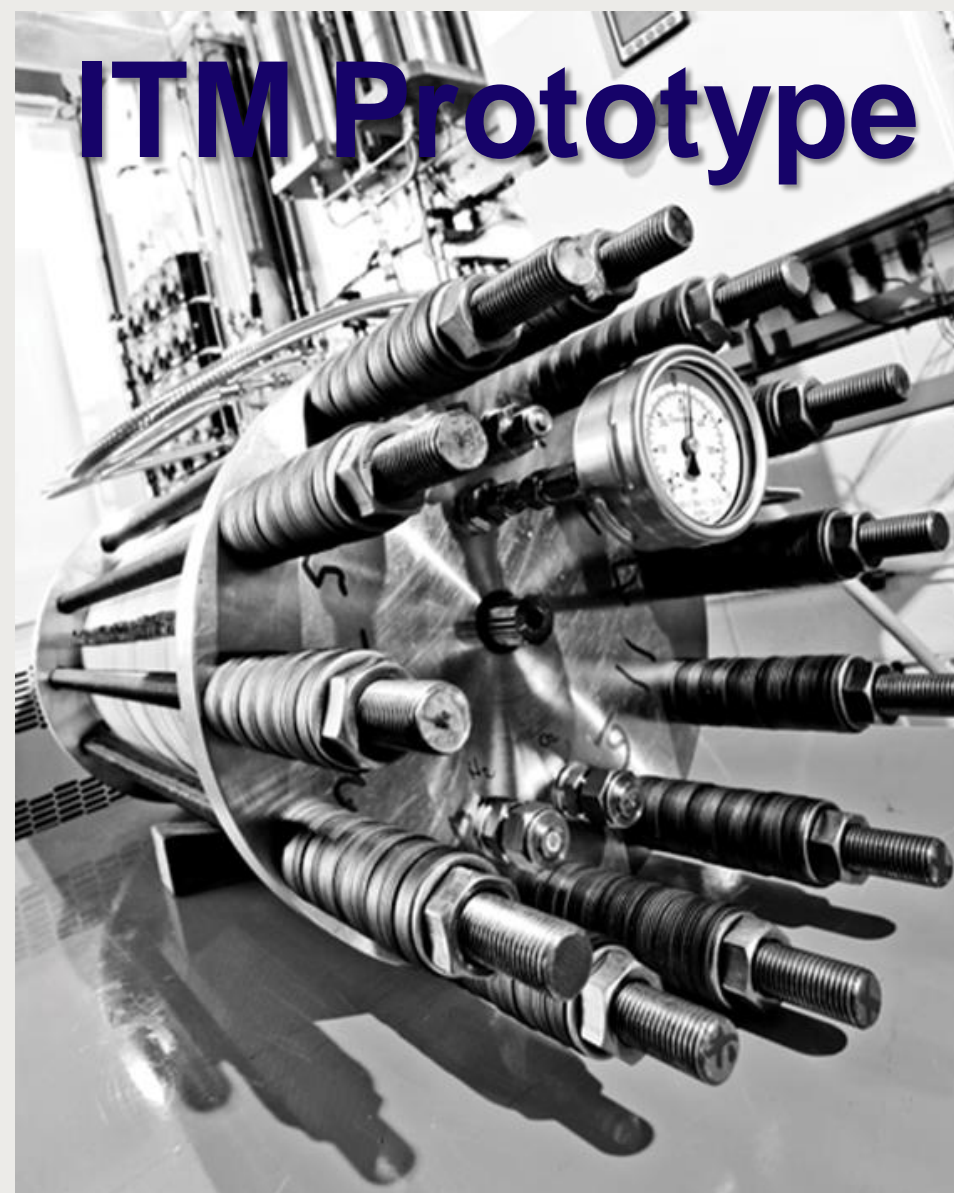

- Call year: 2015
- Call topic: FCH-02.2-2015 IMPROVED ELECTROLYSIS FOR DISTRIBUTED HYDROGEN PRODUCTION
- Project dates: 01/04/2016 – 31/03/2019
- Total project budget: 2,654,250.00 €
- FCH JU max. contribution: 2,499,999.00 €
- Other financial contribution: balanced by ITM
- Partners: CONSIGLIO NAZIONALE DELLE RICERCHE (CNR-ITAE); ITM POWER (TRADING) LIMITED; SOLVAY SPECIALTY POLYMERS ITALY S.P.A.; IRD FUEL CELLS; STADTWERKE EMDEN GmbH; HOCHSCHULE EMDEN/LEER; UNIRESEARCH BV

CONTEXT

HPEM2GAS – High Performance PEM Electrolyzer for Cost-effective Grid Balancing Applications

- As more renewables are being integrated to the grid, there is a need to develop high performance electrolyzers to provide superior grid-balancing services and to produce “green” hydrogen for fuel cell vehicles and other applications.
- Hydrogen appears the most appropriate choice for at-scale decarbonization of selected segments in transport, industry, and buildings.
- HPEM2GAS is addressing these aspects to contribute in making hydrogen the future energy carrier.

Wind turbine power profile

PROJECT SUMMARY & OBJECTIVES

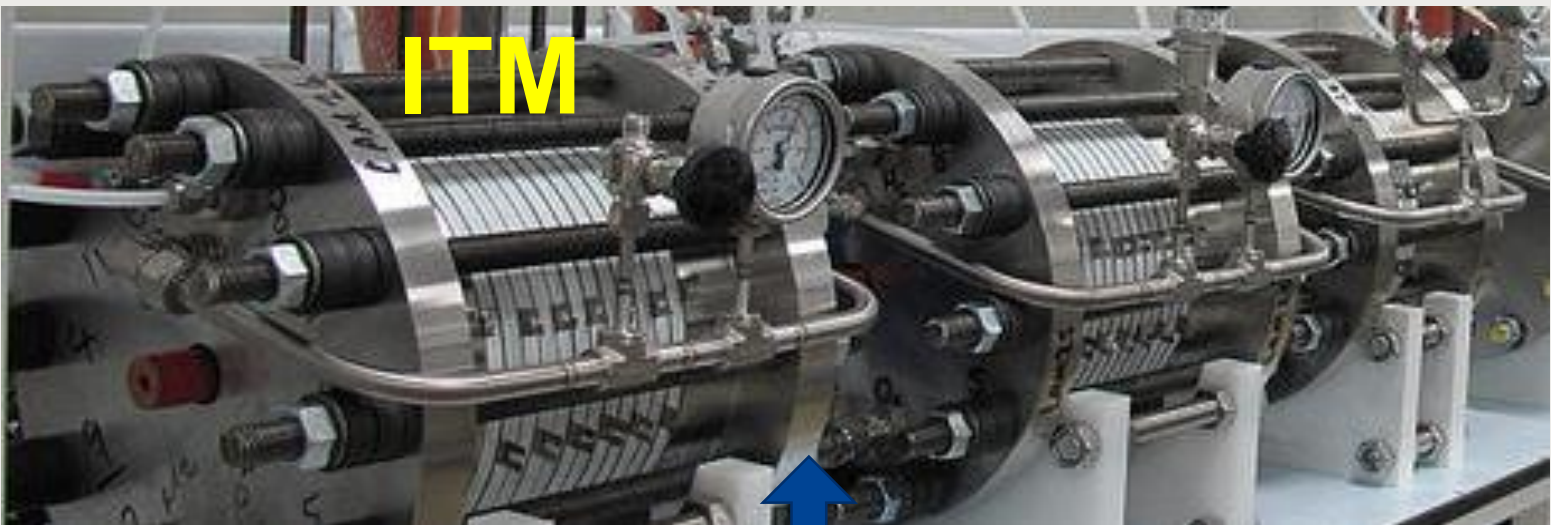

HPEM2GAS’s ambition is to realise breakthroughs in PEM water electrolysis for Distributed Hydrogen Production

- The concept and approach are targeted to improve stack performance (180 kW; 75 cells, 3 A cm⁻² @ 1.8 V/cell), energy efficiency (82% or 48 kWh/kg H₂) , stack lifetime (degradation rate <5 μV/h during 1000 hrs) and reduce system costs (CAPEX < € 1,000/kW for systems of >1 MW) while meeting the technical requirements of electrolyzers for the interaction with the grid and renewable energy sources (100% of nominal load per second; minimum load range 5-10%).

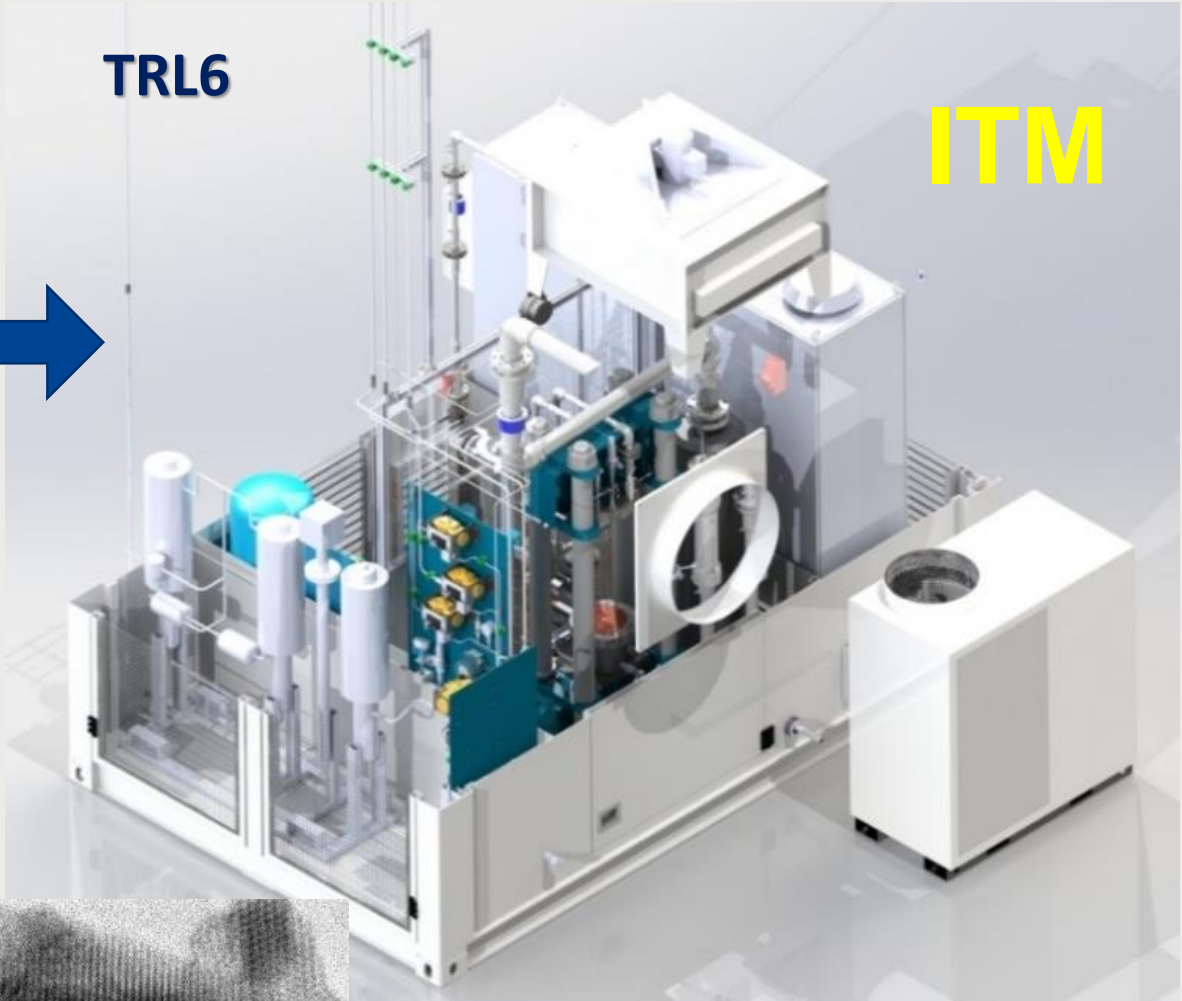

Positioning vs. SoA

Parameter	HPEM2GAS	SoA
Current density A cm ⁻² @ 1.8 V	3	2
Energy consumption kWh/kg H ₂	48 (54)	57
Degradation %/1000hrs	0.25 (0.2)	0.25
PGM loading mg/W	0.07 (0.3)	0.5-1.5
CAPEX € /(kg H ₂ /day)	< 2,250	< 2,900

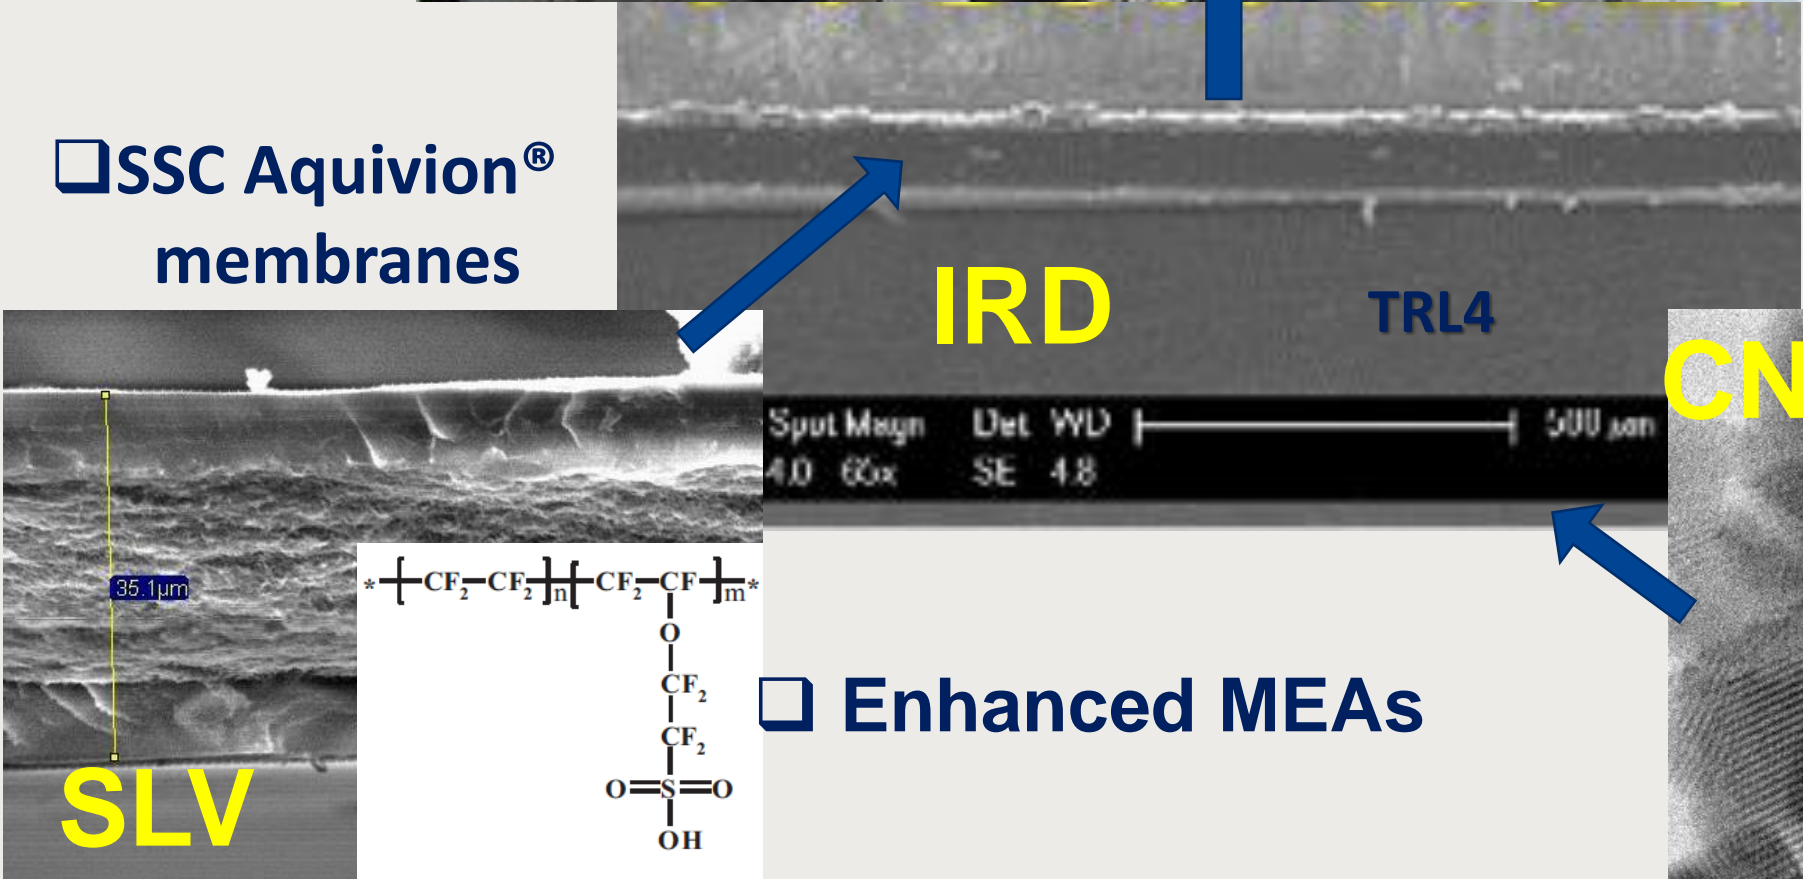

❑ Improved stack design

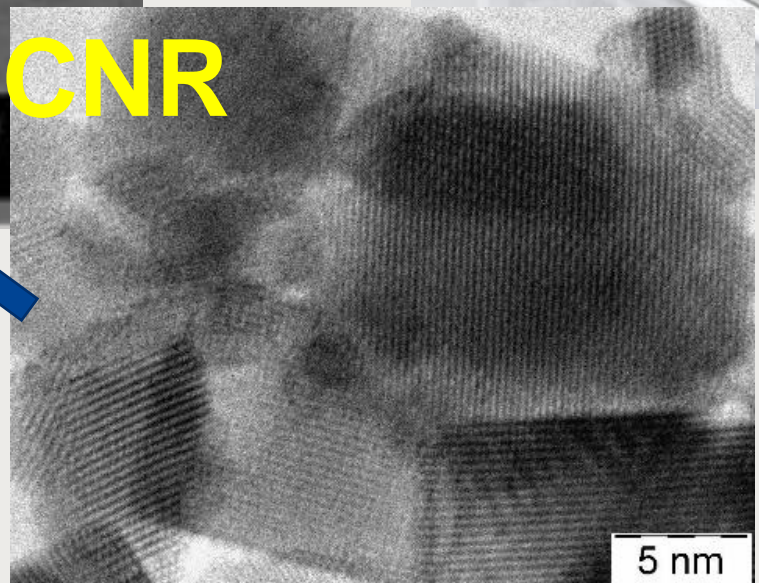

❑ Advanced BoP and safety integrated system

❑ SSC Aquivion® membranes

❑ Enhanced MEAs

❑ Nanostructured electro-catalysts

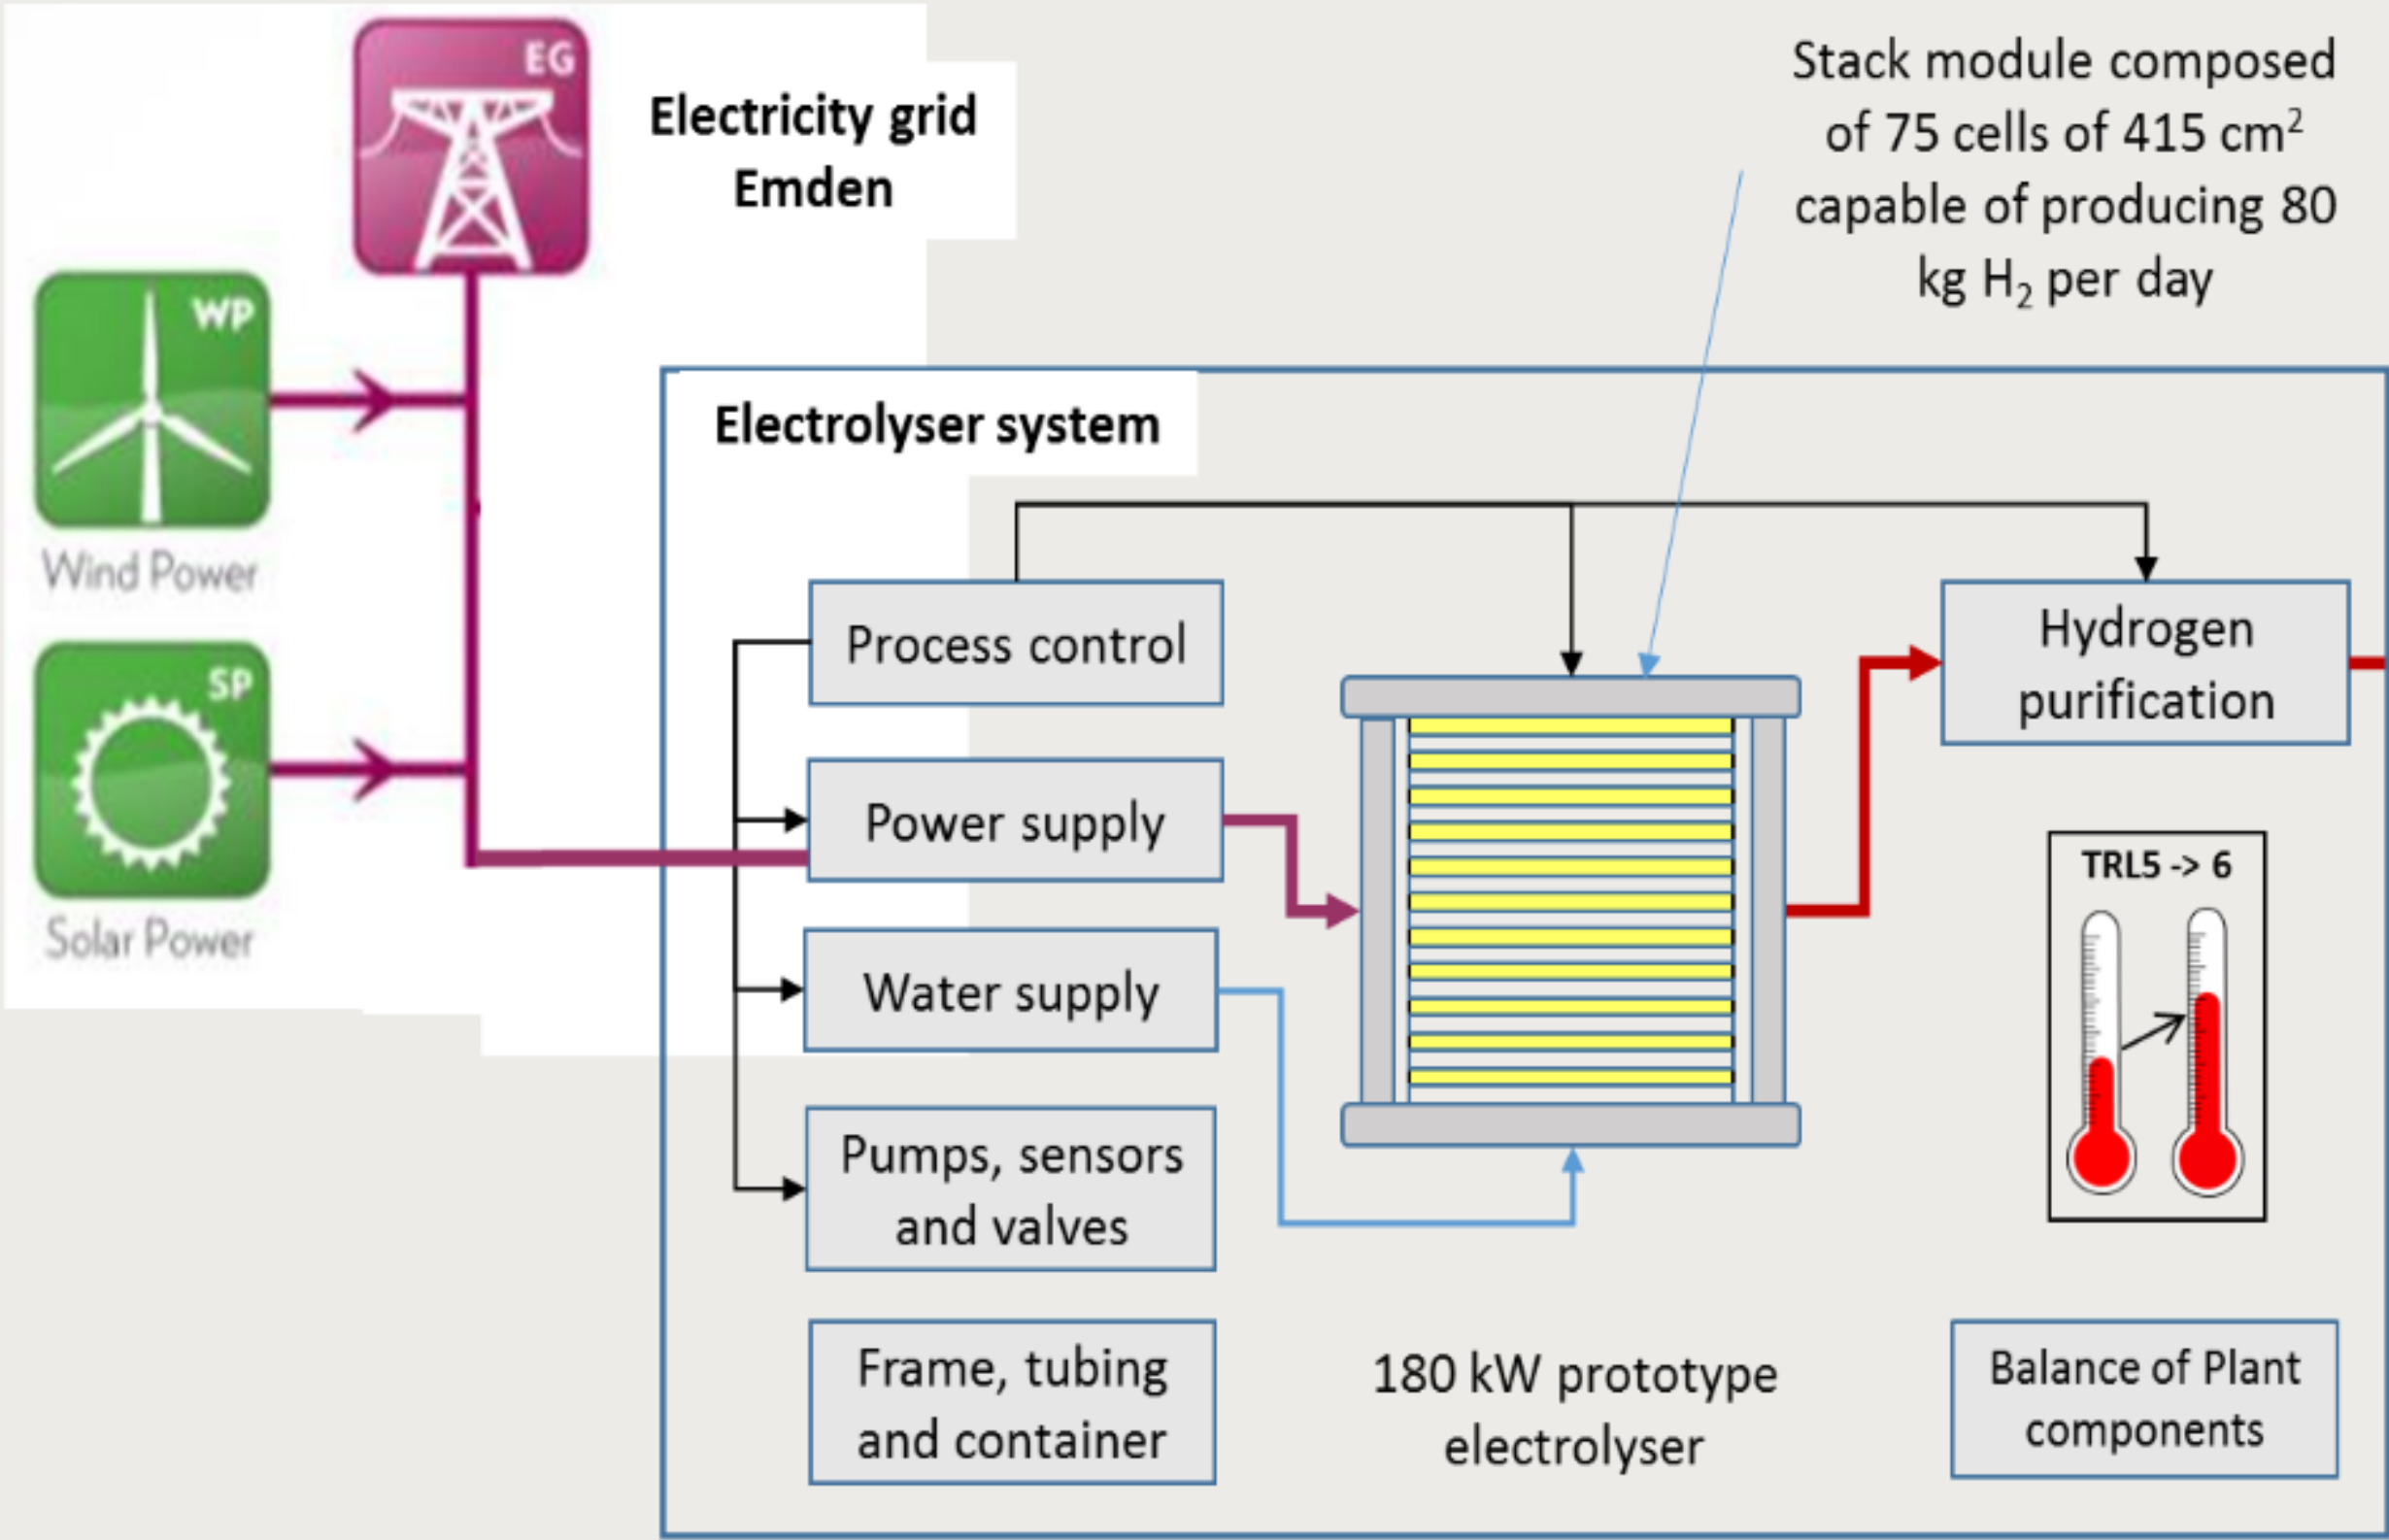

PROJECT SUMMARY

Field testing at Emden (Germany) and follow-up plan

System design, system optimization, prototyping and validation in a field test at Emden

Power-to-gas

- Activities**
- Performance monitoring
 - System engineering and assessment for cost reductions in system components
 - Cost and life cycle analysis on system level
 - Techno-economic assessment on grid balancing level

Design and cost calculation for a 10 MW system and market research

Assessment of the CAPEX and OPEX for various system sizes and production capacities

Drafting of an exploitation plan and technology roadmap

Follow-Up plan

❑ Stadtwerke Emden (SWE) is the local supplier for electricity, water and gas.

❑ Two wind farms have been built in the city of Emden which provides 117% (240 MWh/y) of the electric energy for homes

- ✓ Need for utilizing excess wind power;
- ✓ Need to address the congestion of transmission;
- ✓ Need to stabilize the electricity grid from frequent fluctuations;

PROJECT PROGRESS/ACTIONS – Stack Efficiency

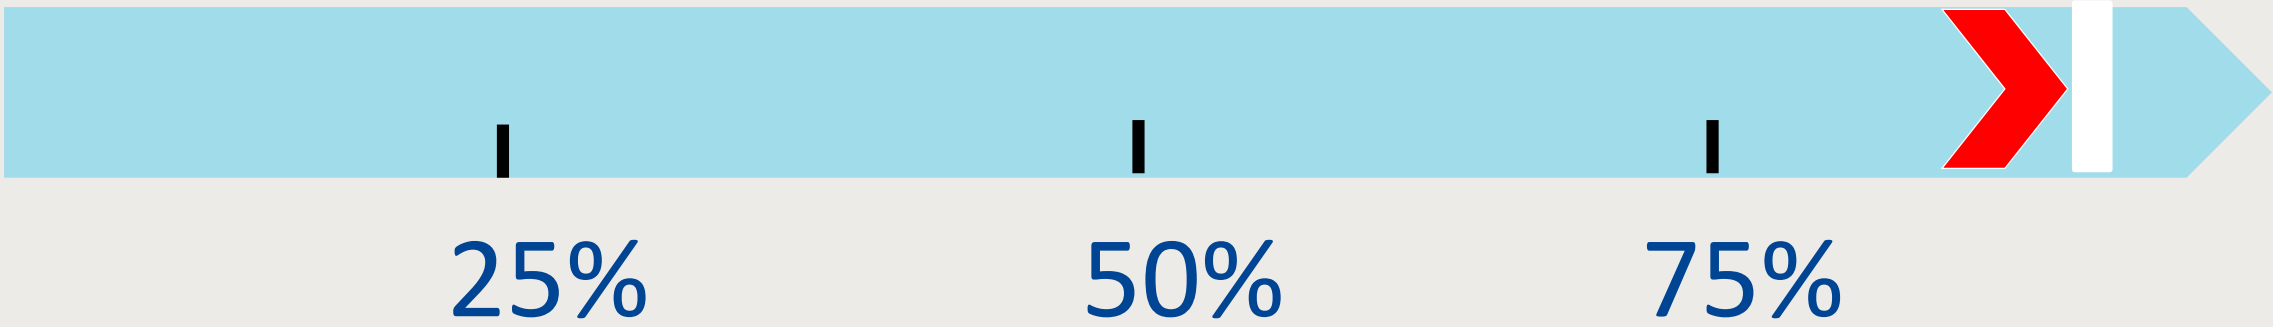

Achievement to-date
% stage of implement.

PROJECT START
VALUE
Eff. 77 %
@ 0.83 A cm⁻²

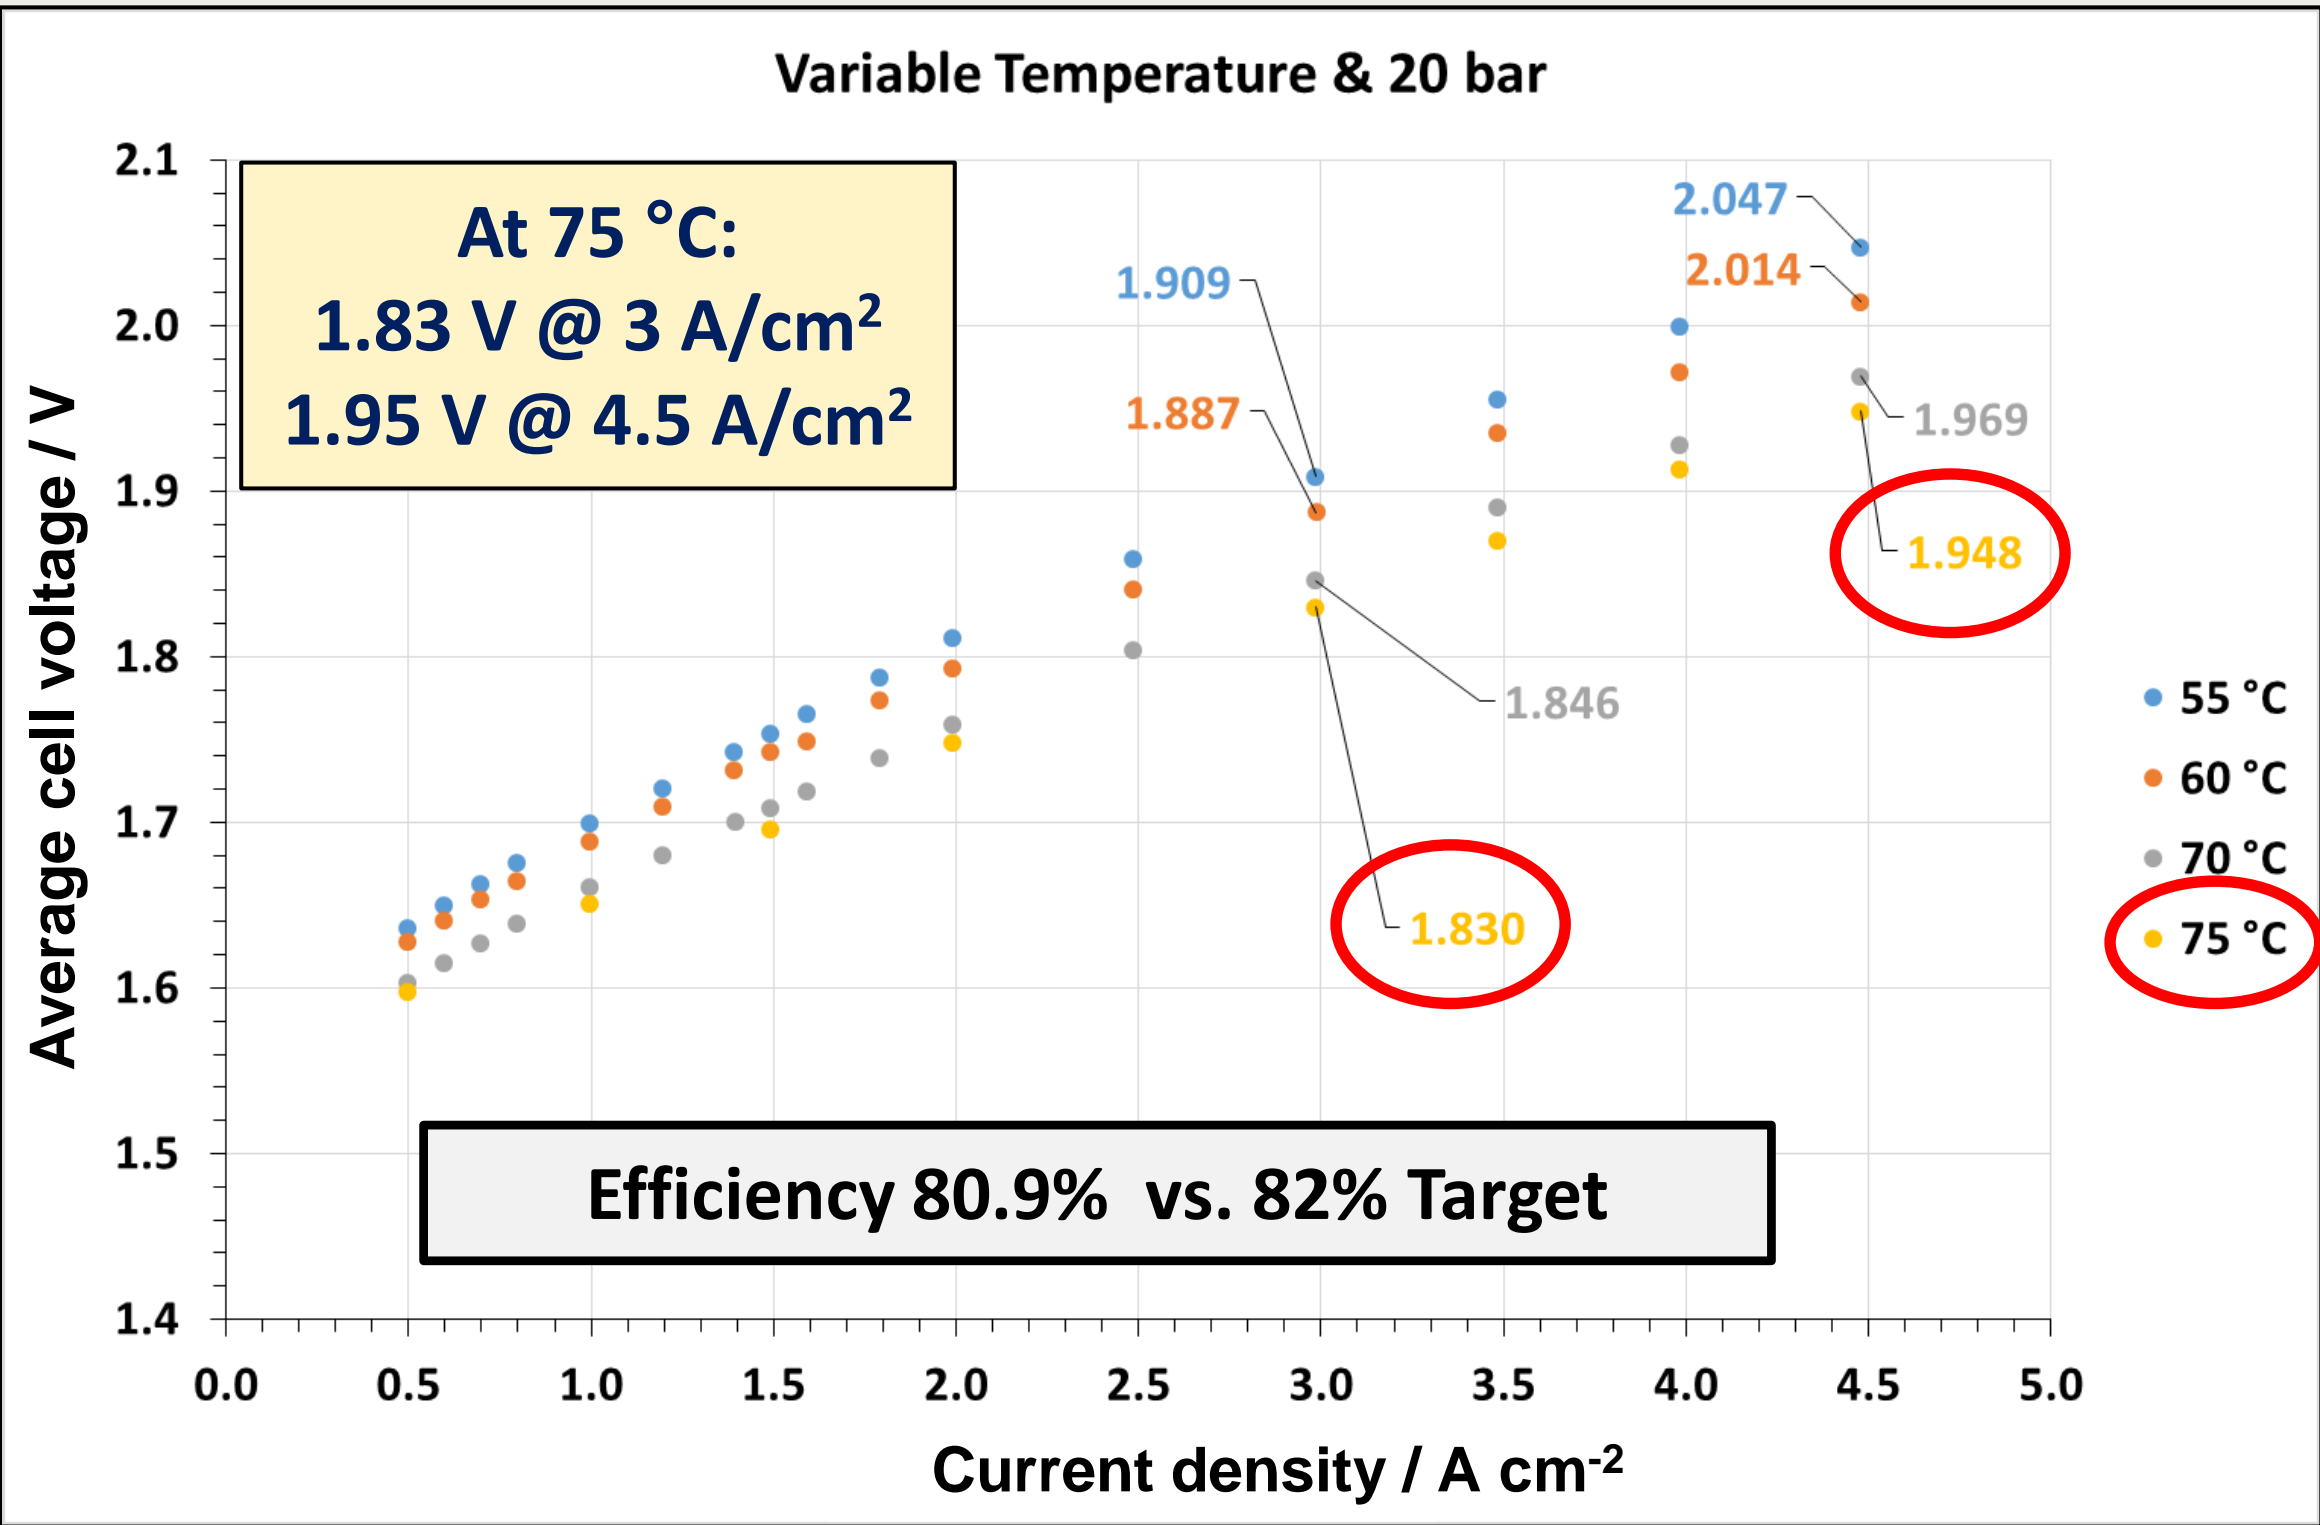

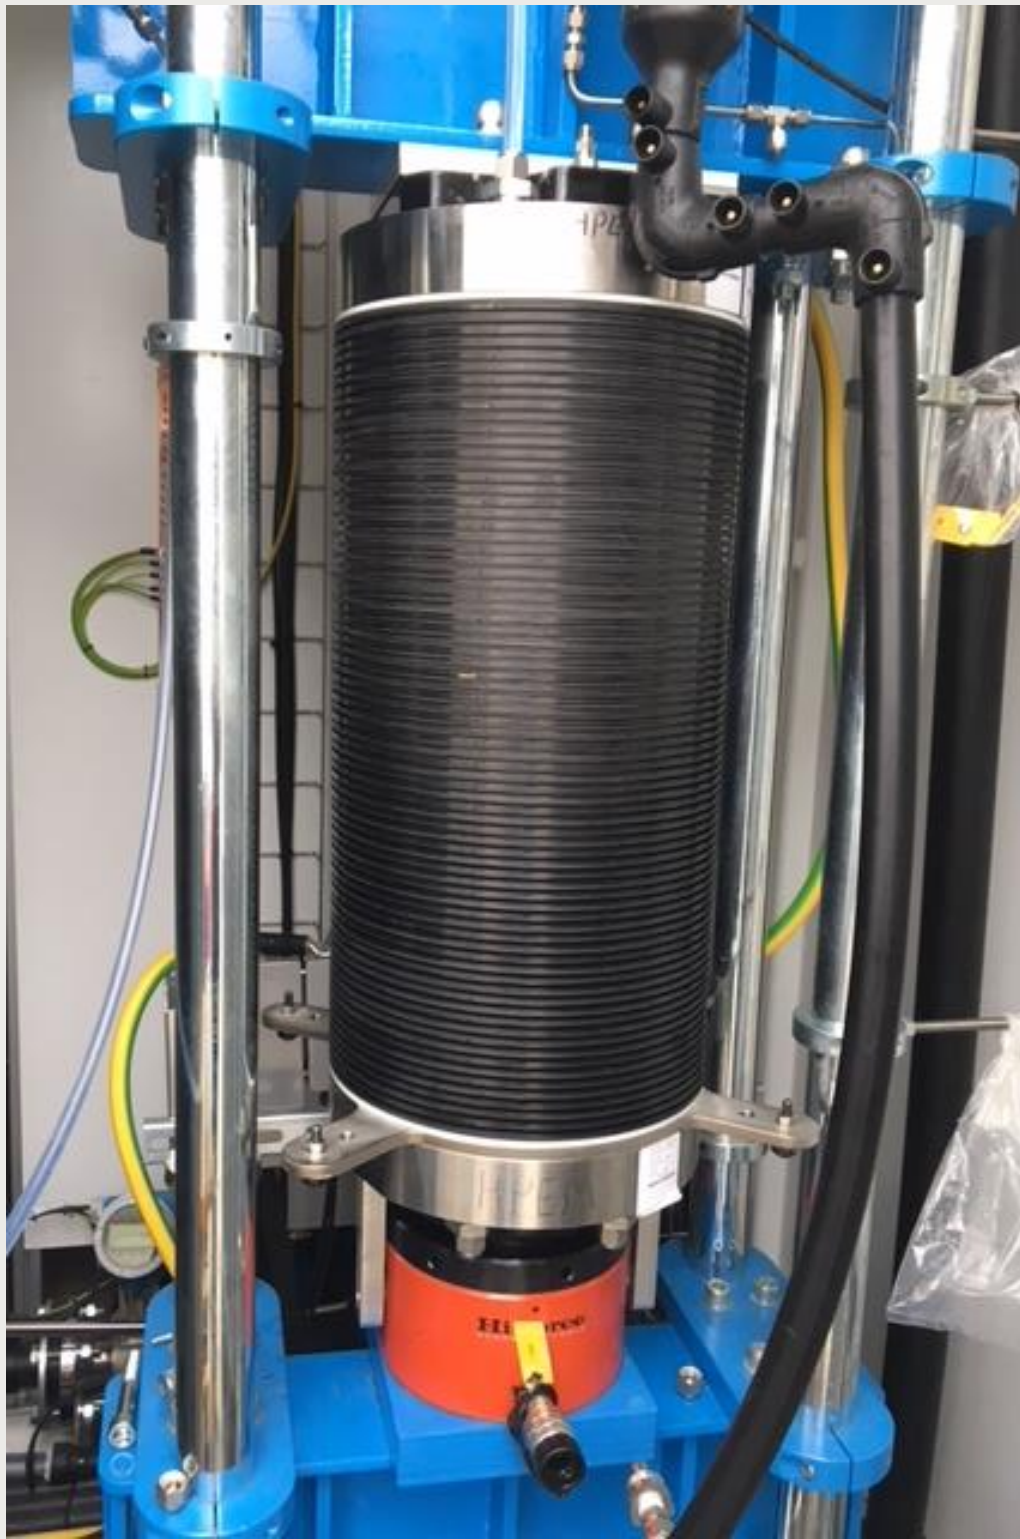

Efficiency: 81% at 3 A cm⁻² and 75 °C

TARGET
SYSTEM
EFFICIENCY
82 %

PEM electrolysis
stack

Parameter	HPEM2GAS	SoA
Stack efficiency / %	81	75
Current density A cm ⁻² @ 1.8 V	3	2
PGM loading mg/W	0.3	0.5
Temperature °C	75	-

PROJECT PROGRESS/ACTIONS – System Energy Consumption

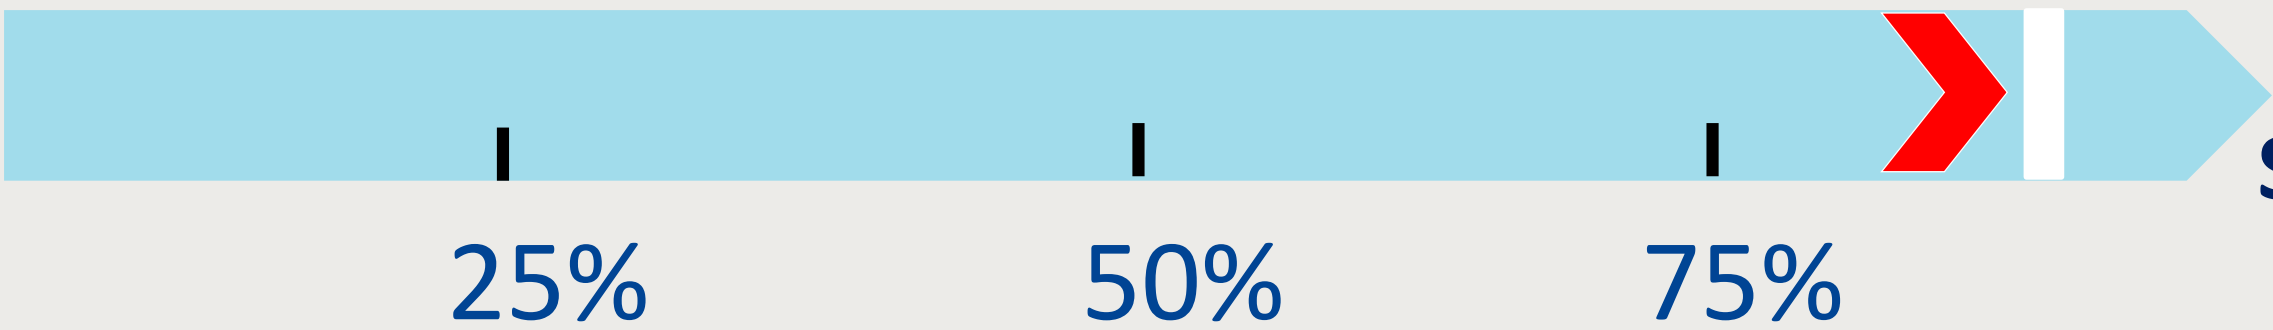

Energy consumption: 54.2 kWh/kg H₂ at 3 A cm⁻² and 55 °C

Achievement to-date
% stage of implement.

PEM electrolysis
system

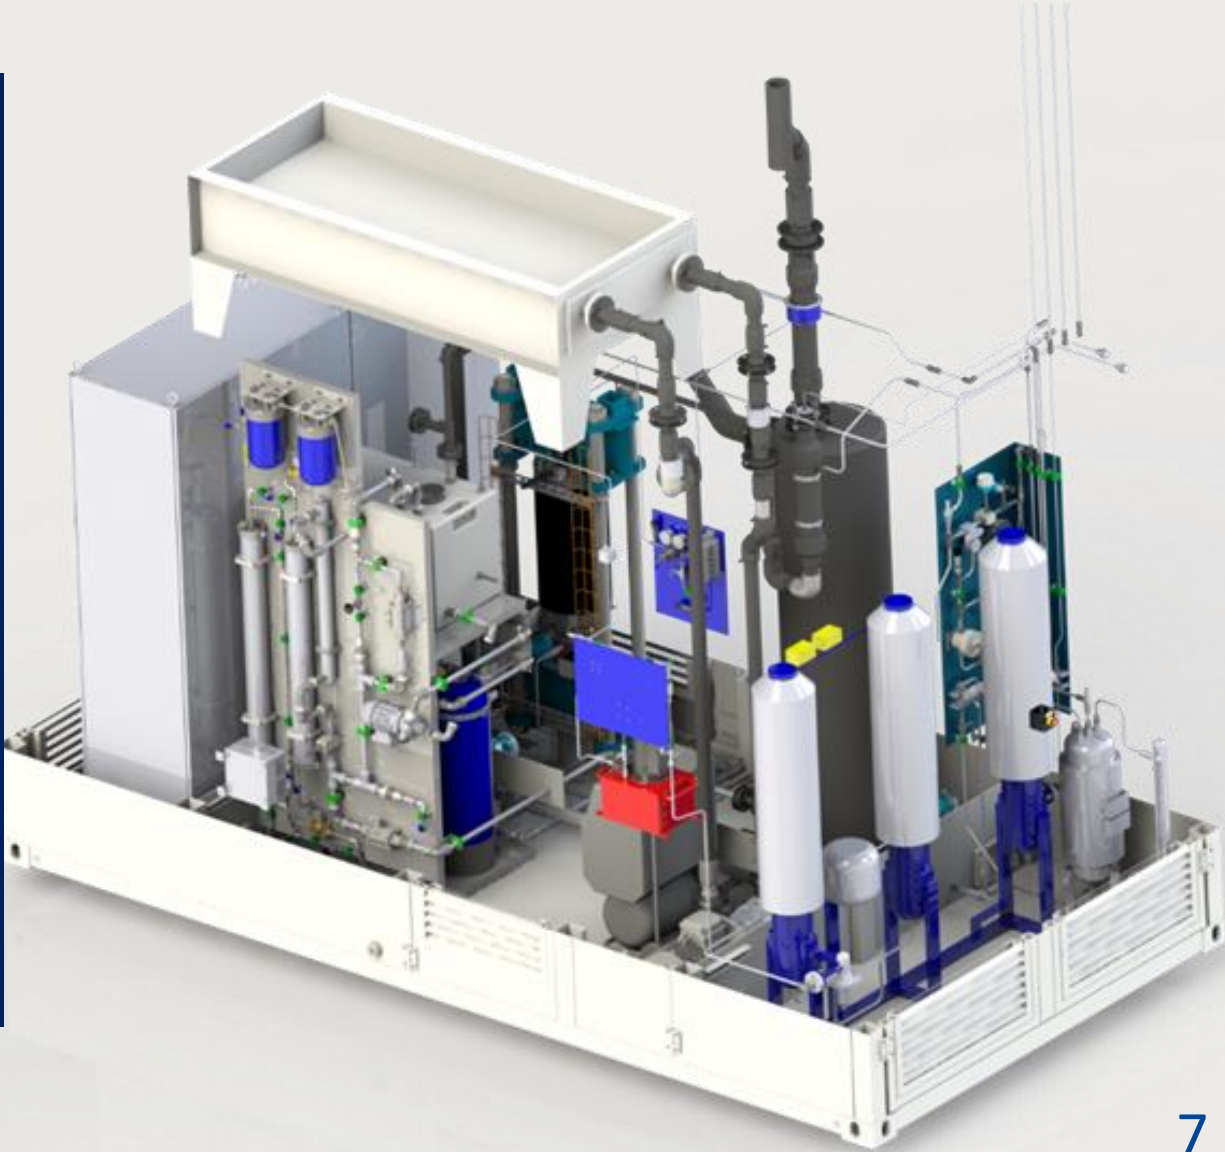

PROJECT START
VALUE
Energy
Consumption
53.2 kWh/kg H₂
@ 0.83 A cm⁻²

TARGET
SYSTEM ENERGY
CONSUMPTION
48 kWh/kg H₂

System energy consumption kWh/kg H ₂	54	47	57	48	55
Current density A cm ⁻² @ 1.8 V	3	1	2	-	2.2
Temperature	54-56 °C	54-56 °C	-	-	-

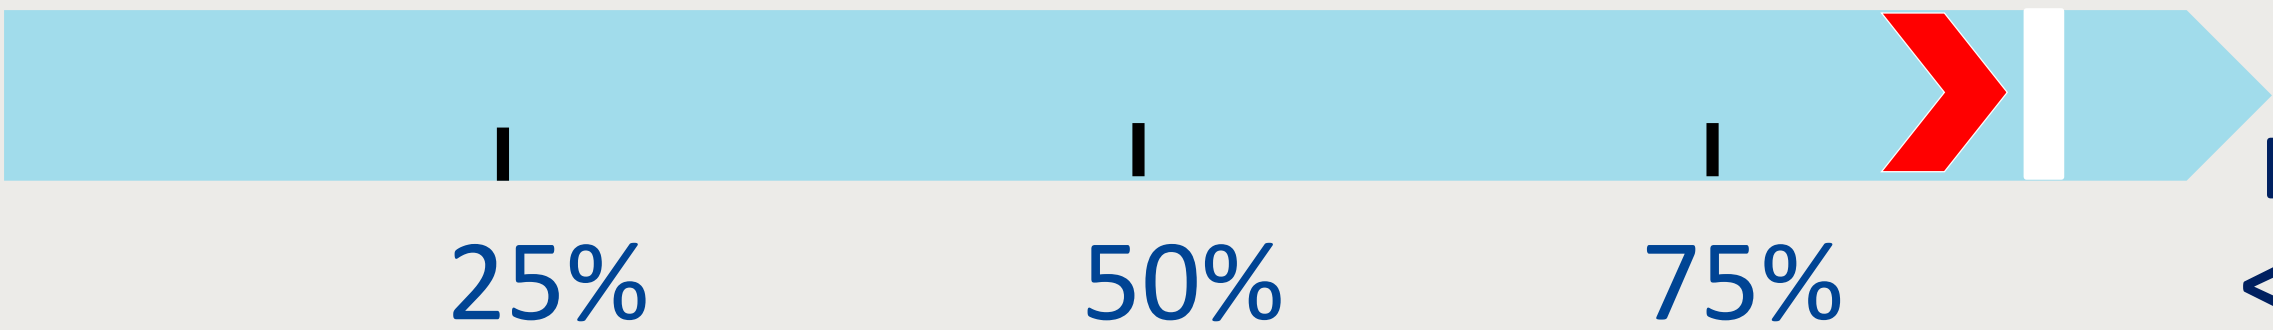

PROJECT PROGRESS/ACTIONS – Stack degradation rate

Degradation rate: 0.2 %/1000 hrs at 3 A cm⁻² and 55 °C

Achievement to-date
% stage of implement.

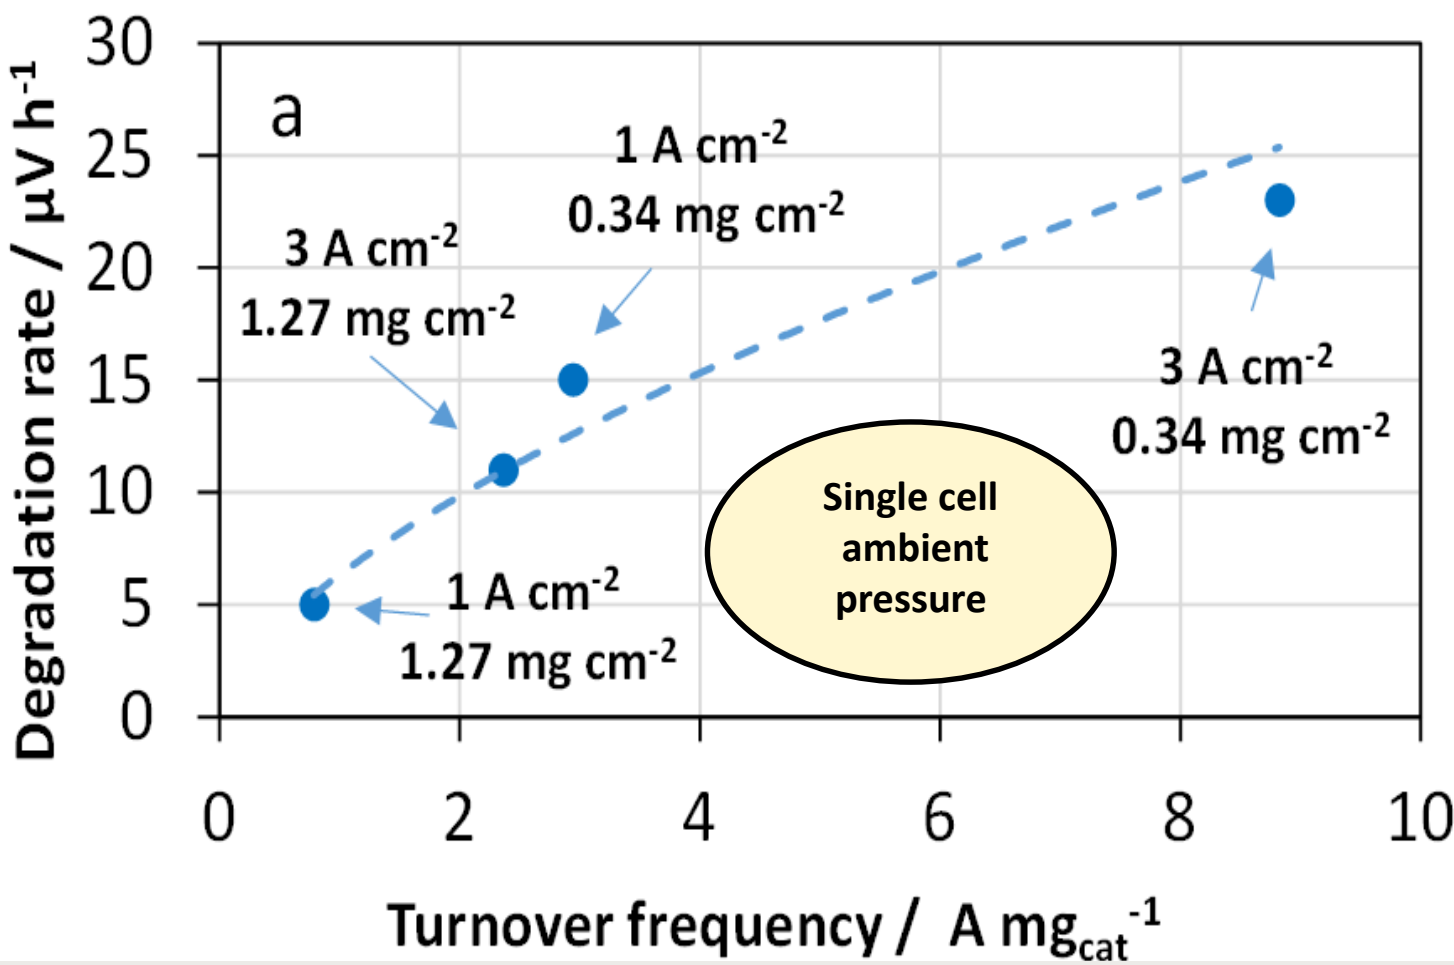

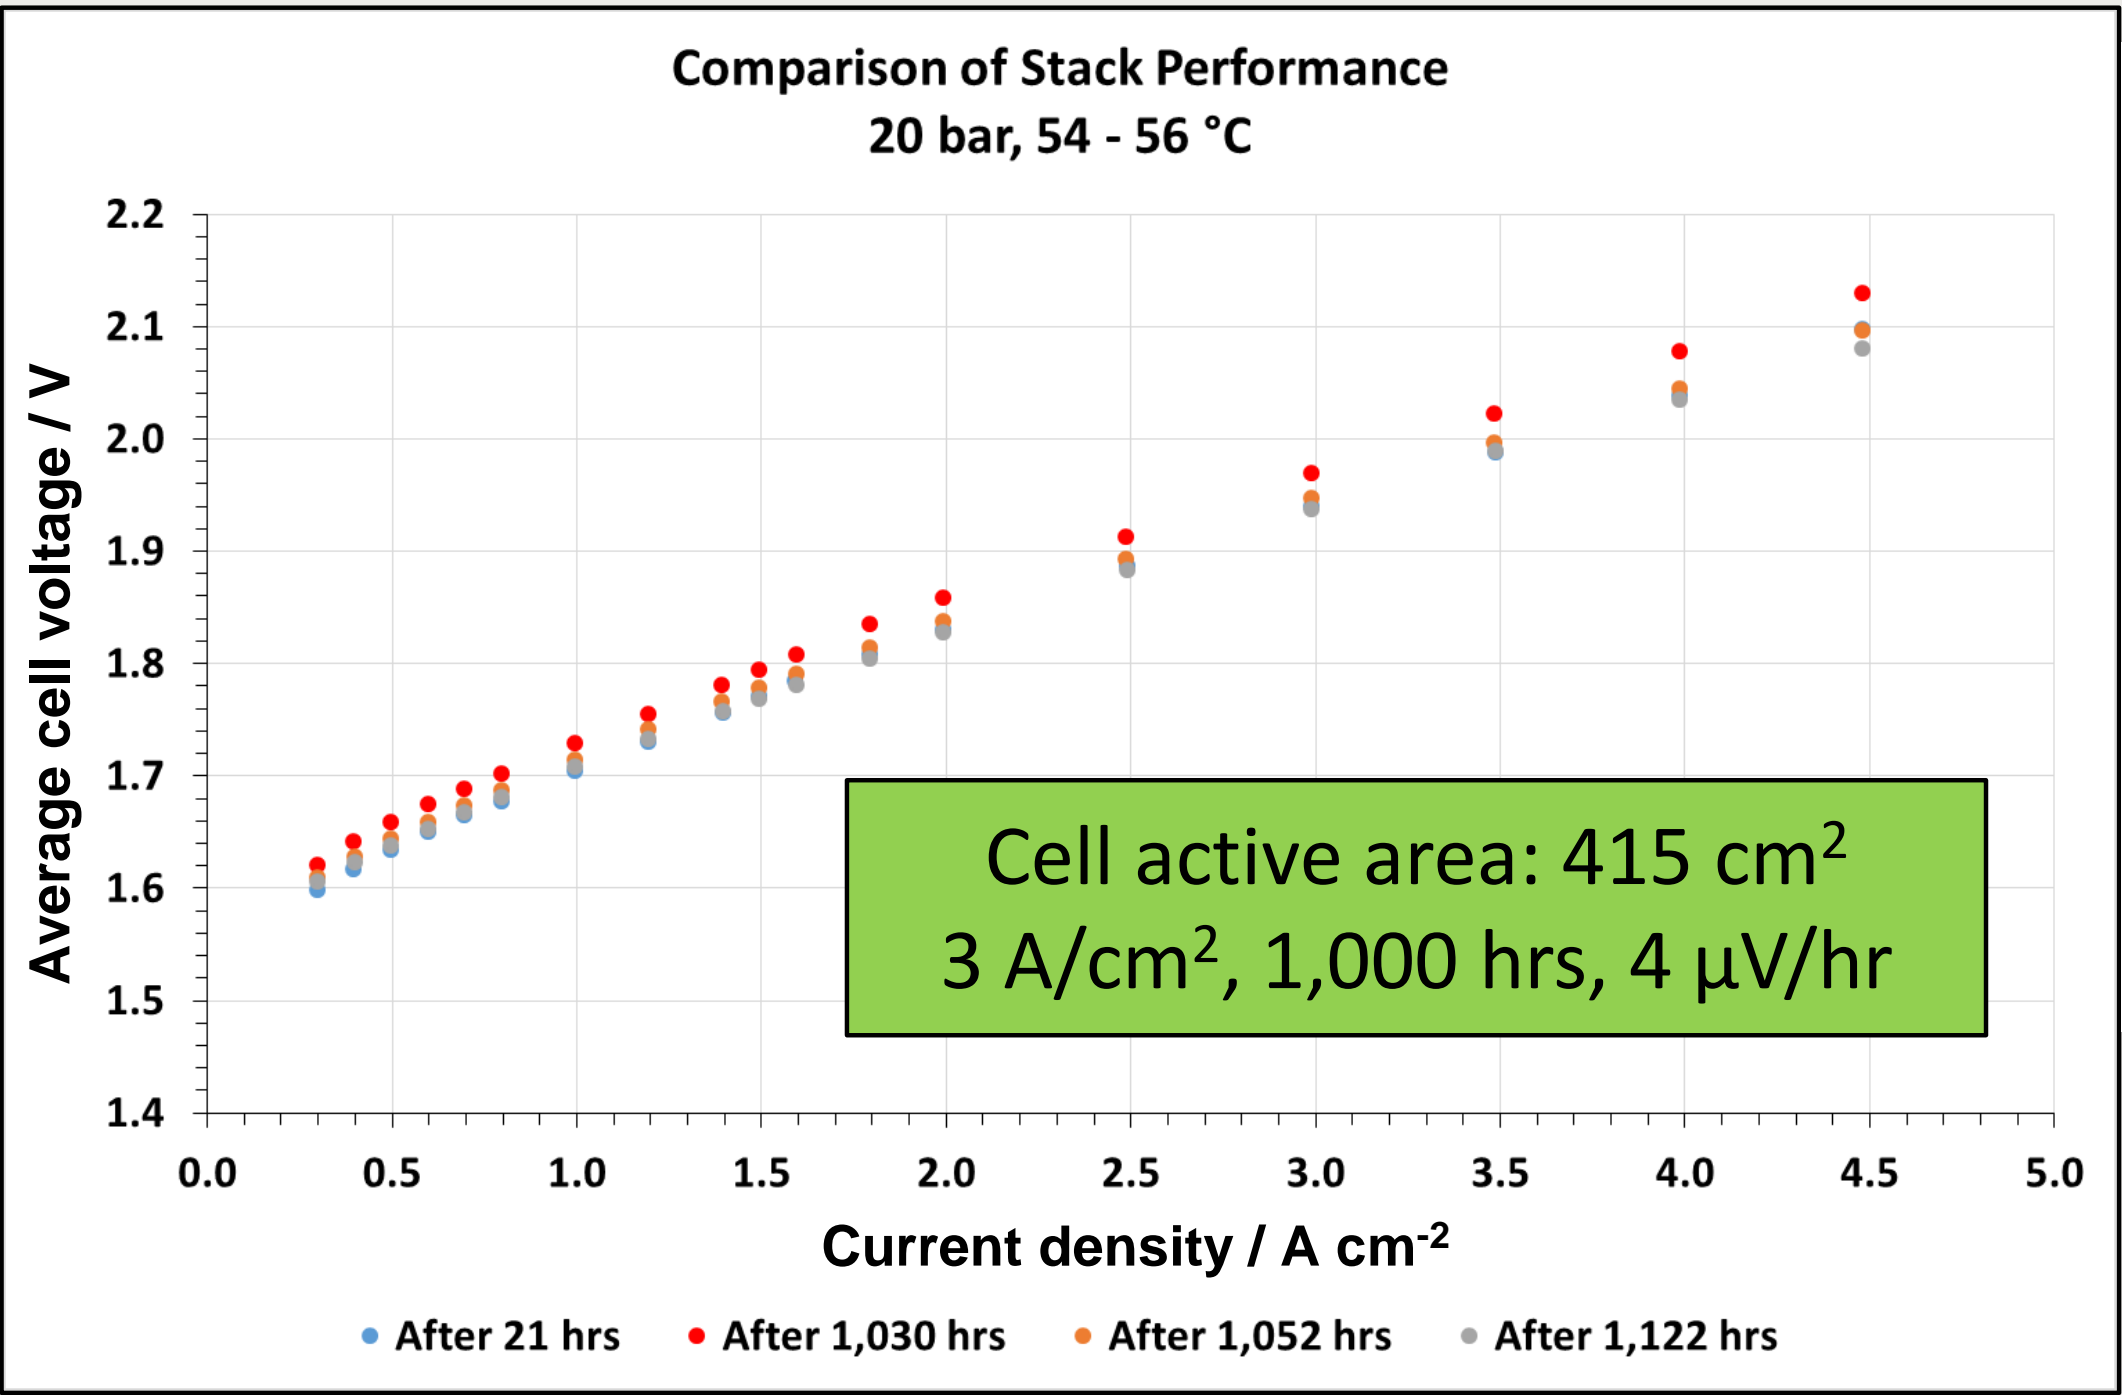

PROJECT START
VALUE
0.55 %/1000 hrs
@ 0.83 A cm⁻²

TARGET
Degradation rate
<0.25 %/1000 hrs

PEM electrolysis
short stack

Parameter	HPEM2GAS	SoA	MAWP 2020 target
Stack degradation %/1000 hrs	0.2	0.25	0.19
Current density A cm ⁻² @ 1.8 V	3	2	2.2
PGM loading mg/W	0.3	0.5-1.5	2.7
Temperature °C	55	-	

The degradation rate increase proportionally with the operating turn-over frequency (TOF) of the anode electrocatalyst

PROJECT PROGRESS/ACTIONS – Operating pressure

Achievement to-date
% stage of implement.

PROJECT START
VALUE
15 bar
@ 0.83 A cm⁻²

Max. operating pressure 50 bar at 3 A cm⁻² and 55 °C

TARGET
Operating
pressure up
to 80 bar

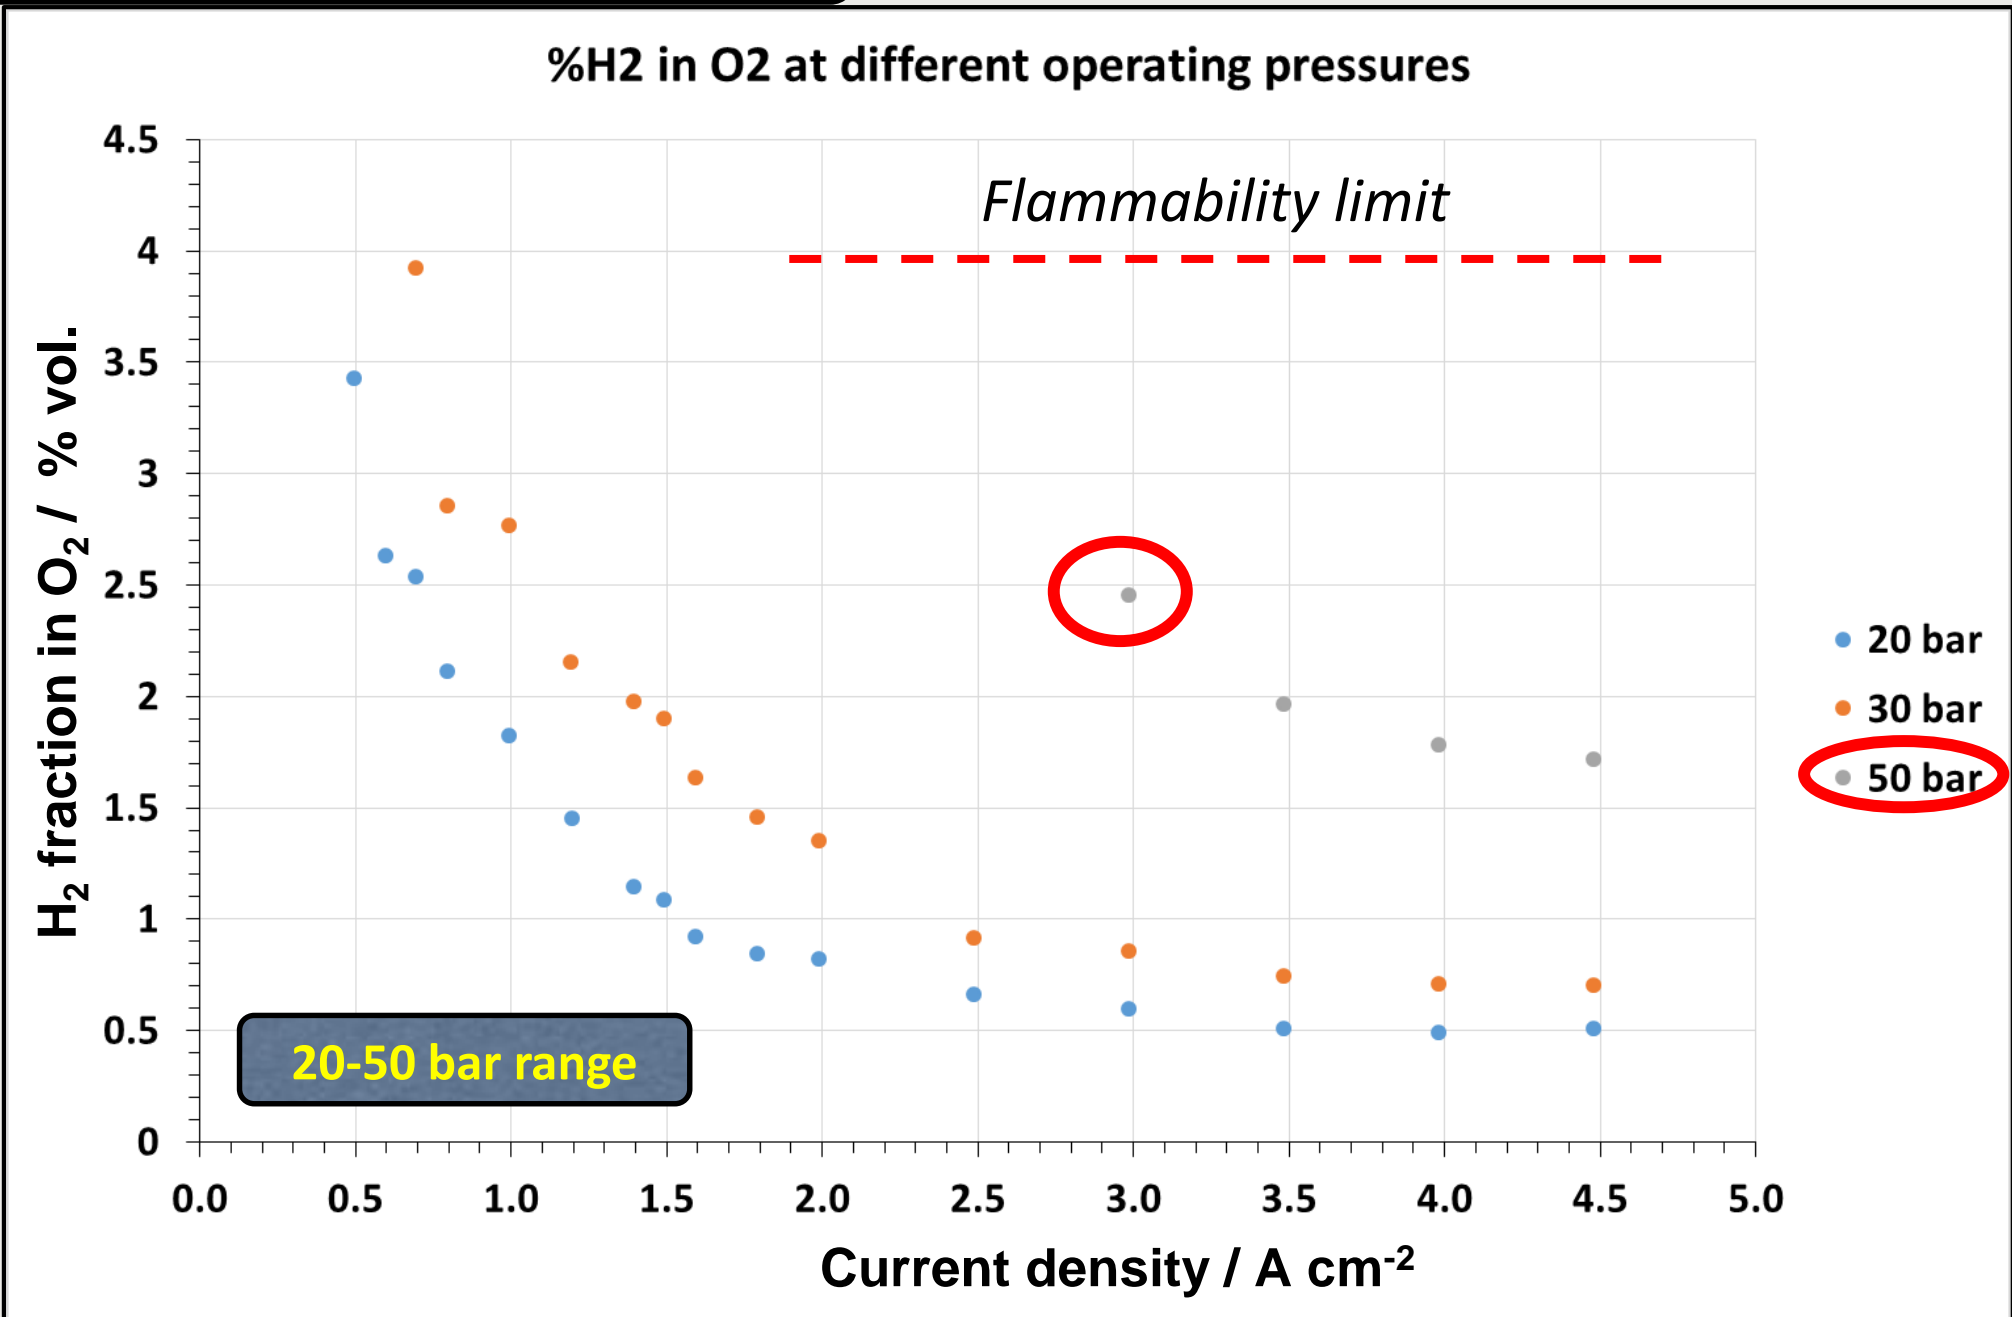

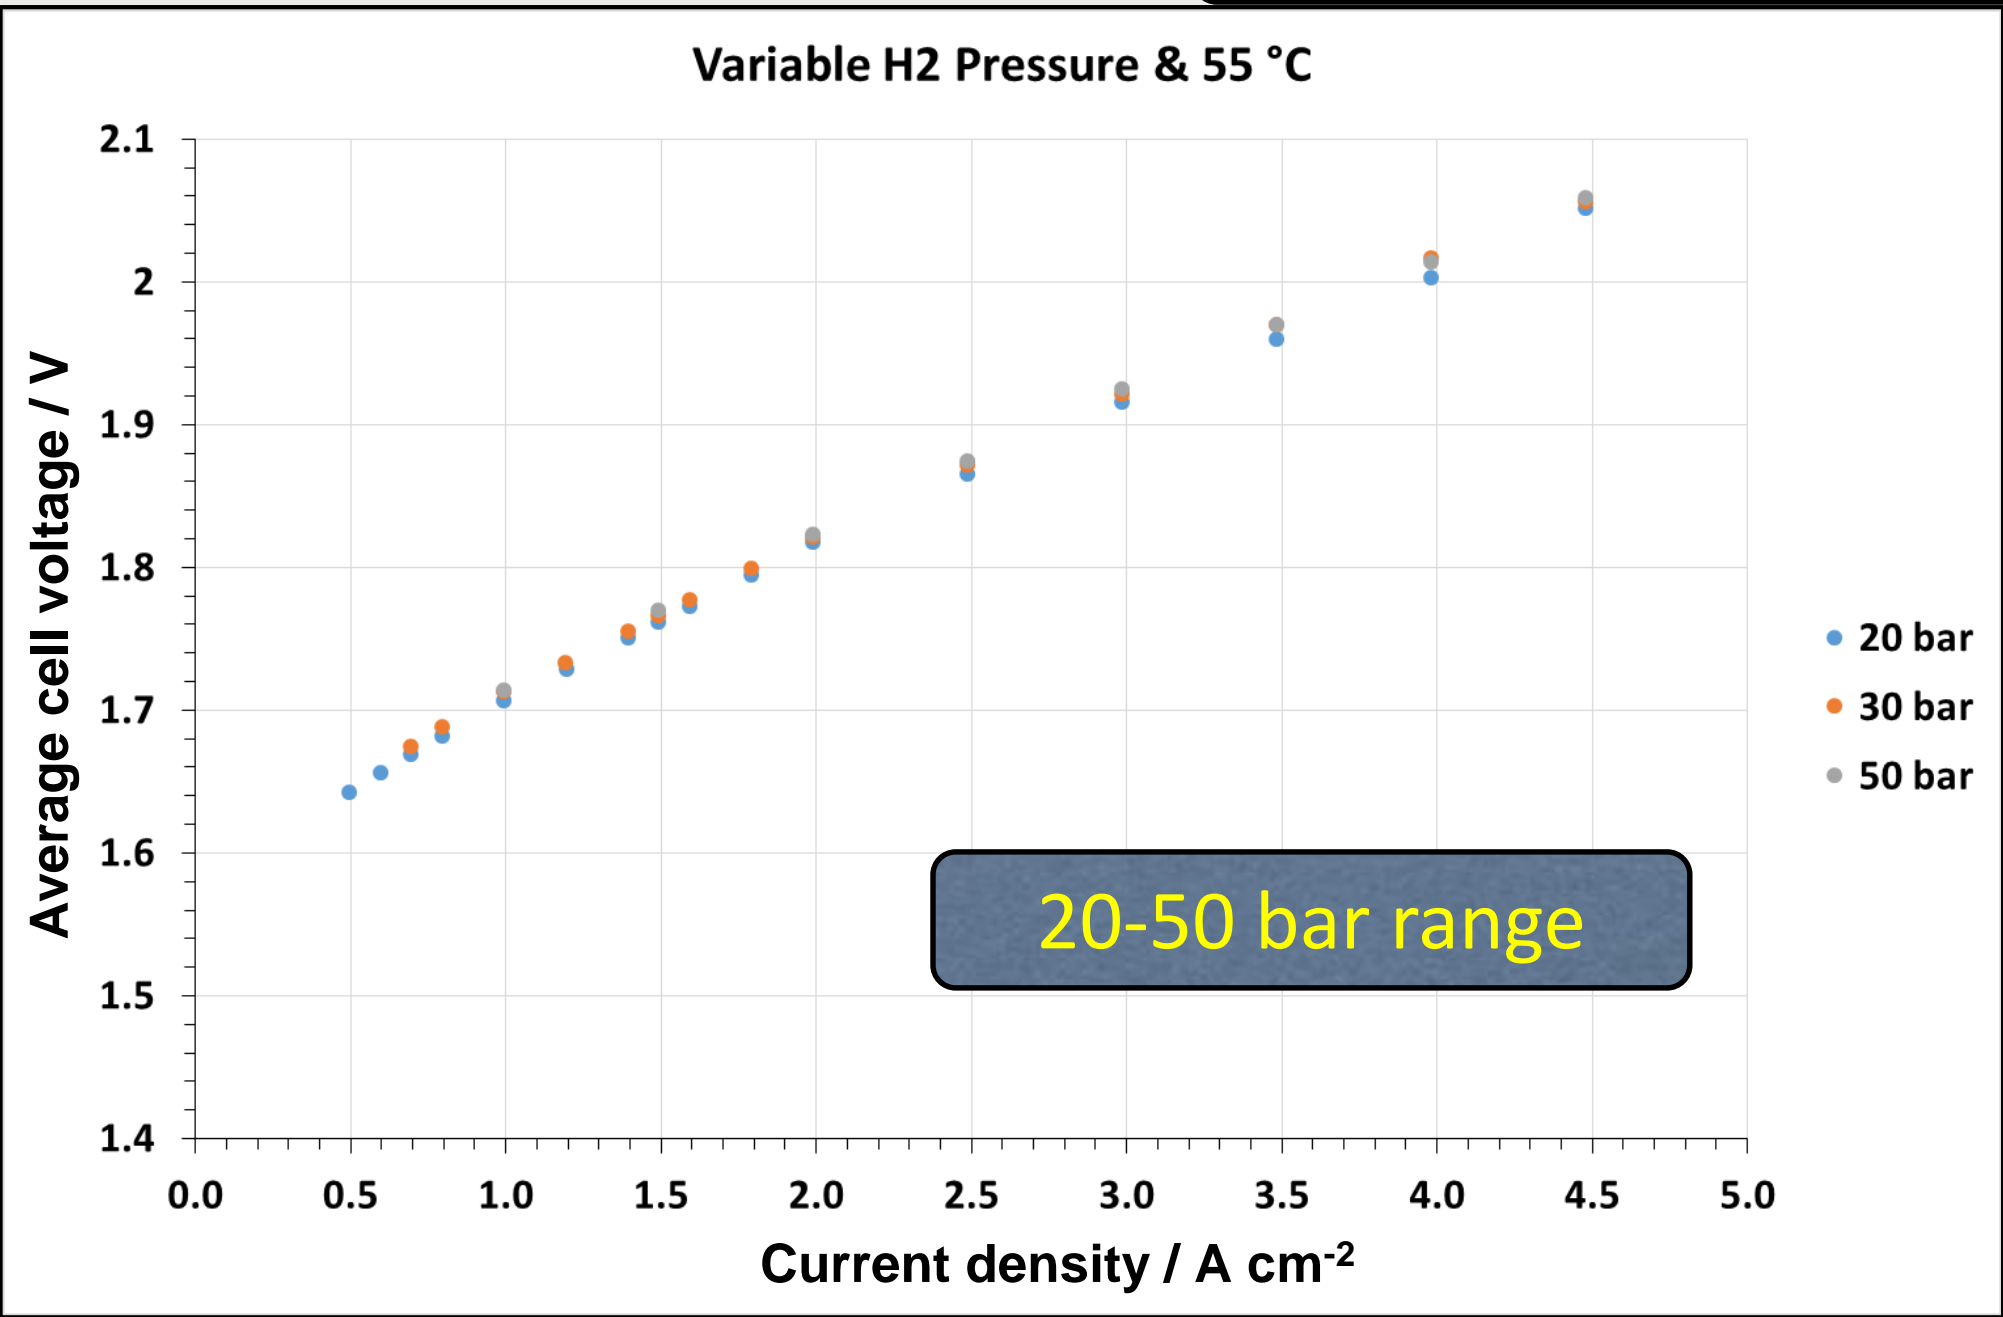

90 µm thick Aquivion® membranes

PEM electrolysis
short stack

Gas cross-over
2.5% H₂ in O₂ @ 3 A/cm²
observed at 50 bar

New strategies:
Recombination catalyst
(not yet implemented
at stack level)

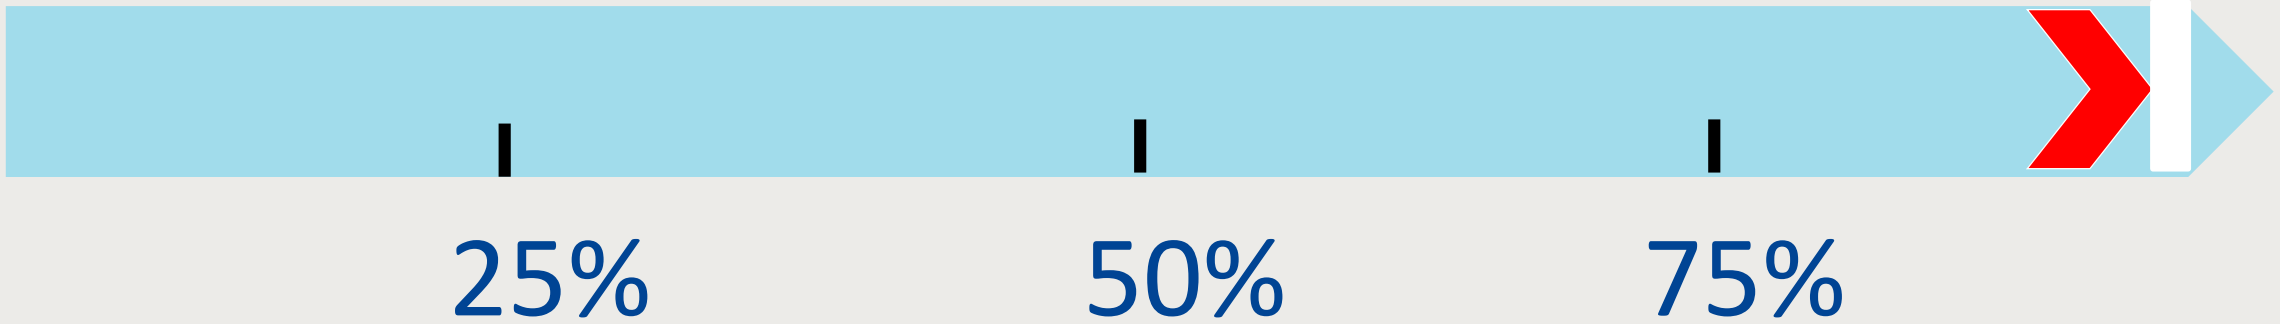

PROJECT PROGRESS/ACTIONS – Dynamic behaviour

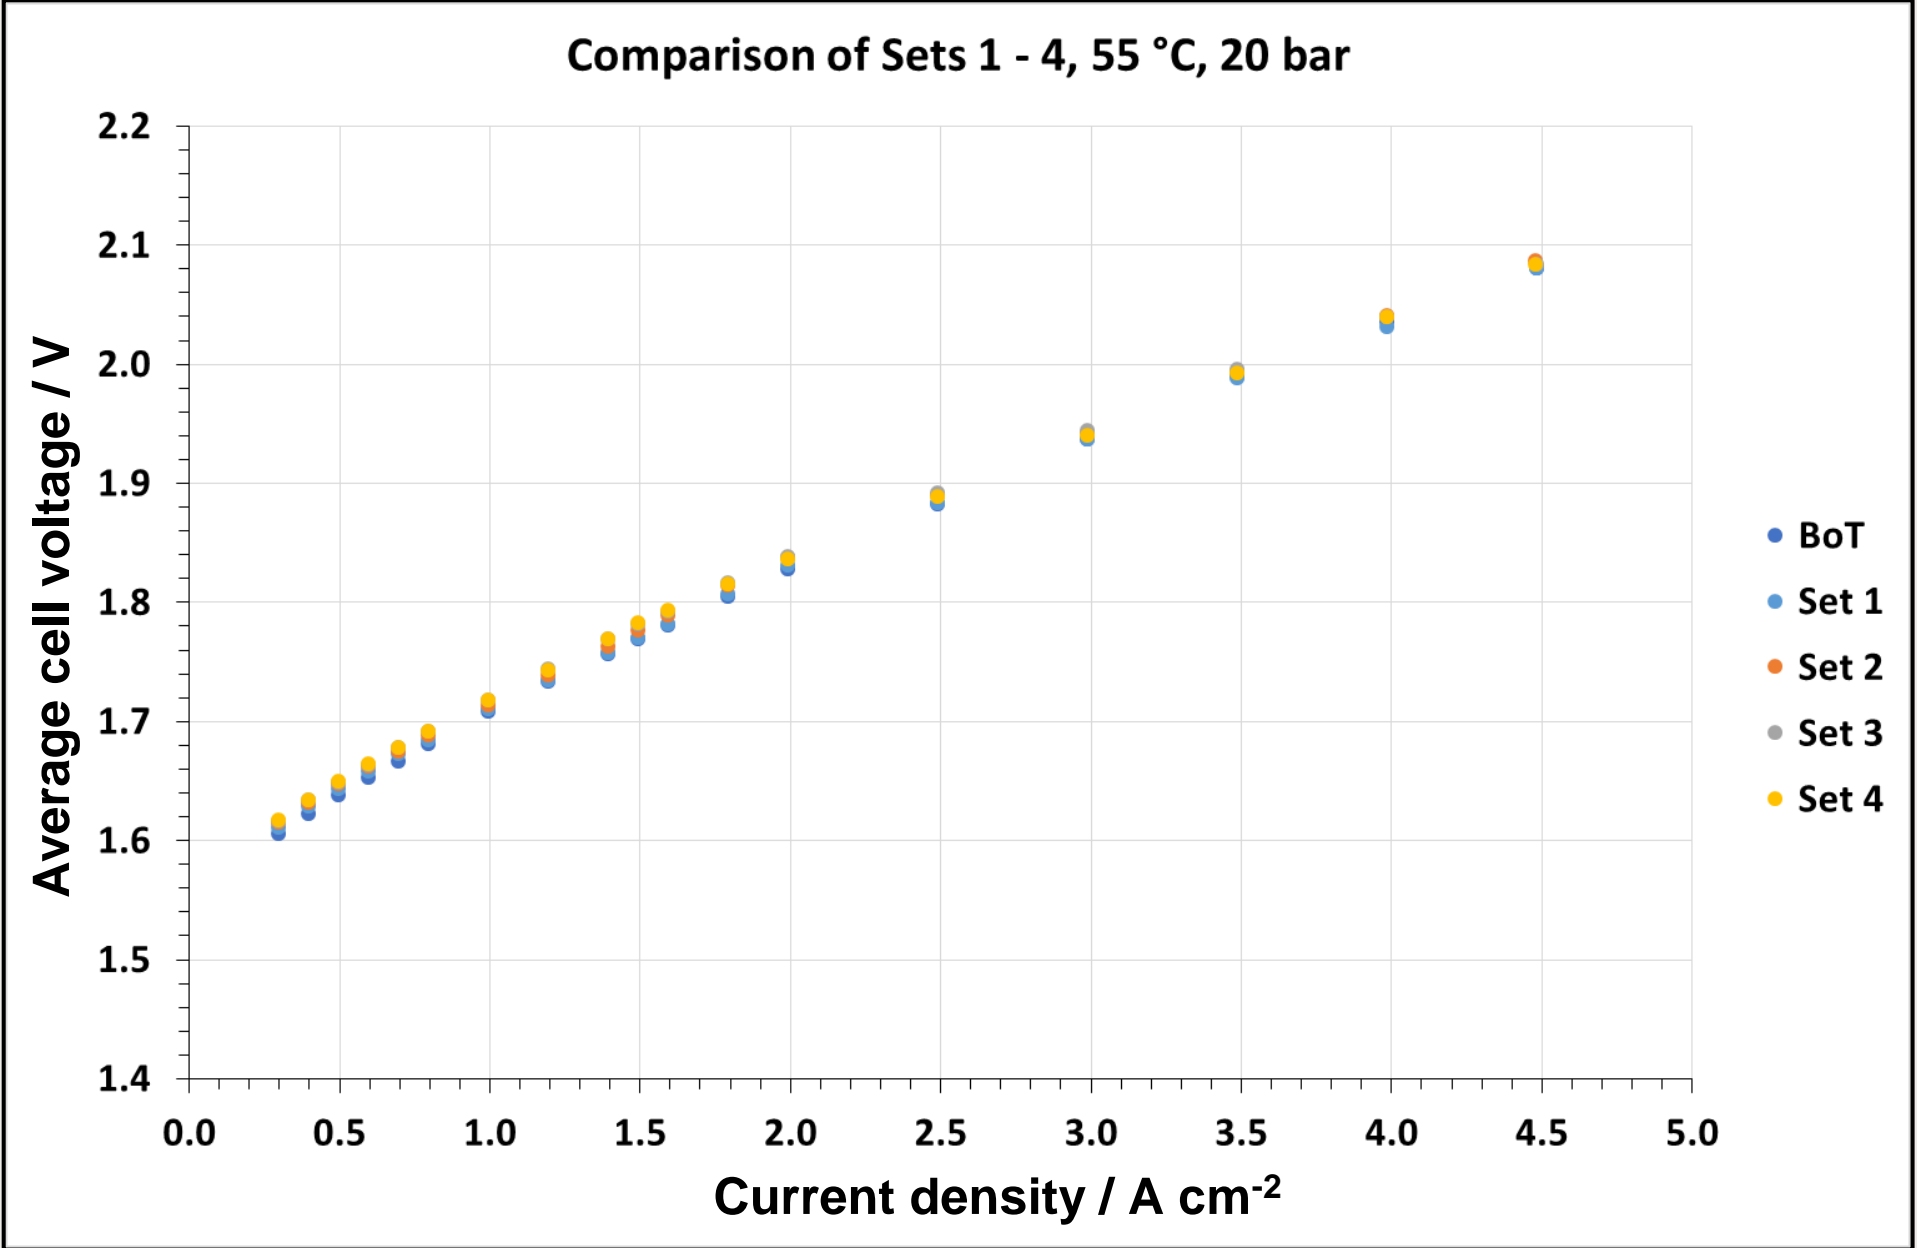

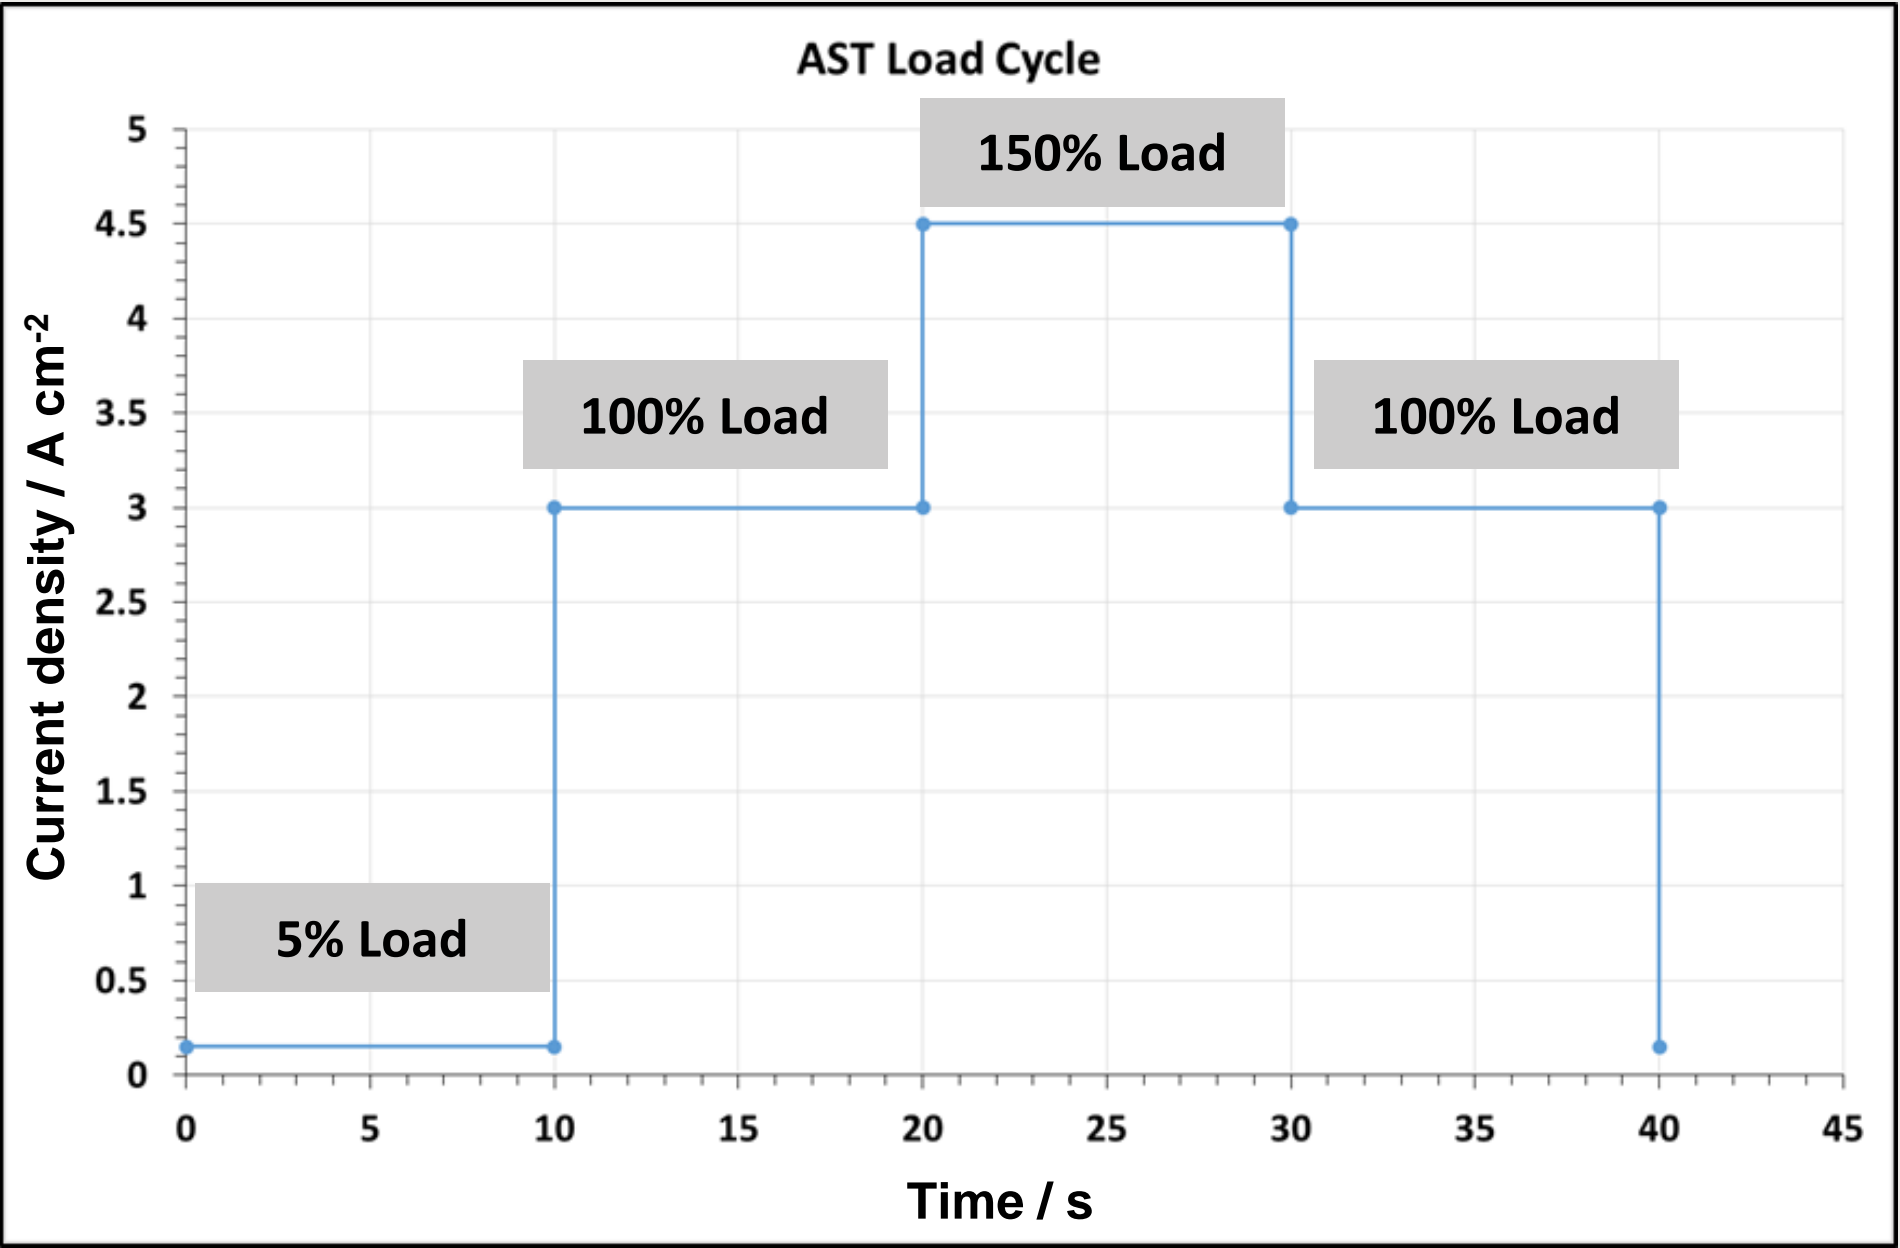

**Achievement to-date
% stage of implement.**

7500 cycles with variable load (from 0.15 to 4.5 A cm⁻²)

TARGET
Ramp rates of up to 100% of nominal load per second and a load range 5%-150%

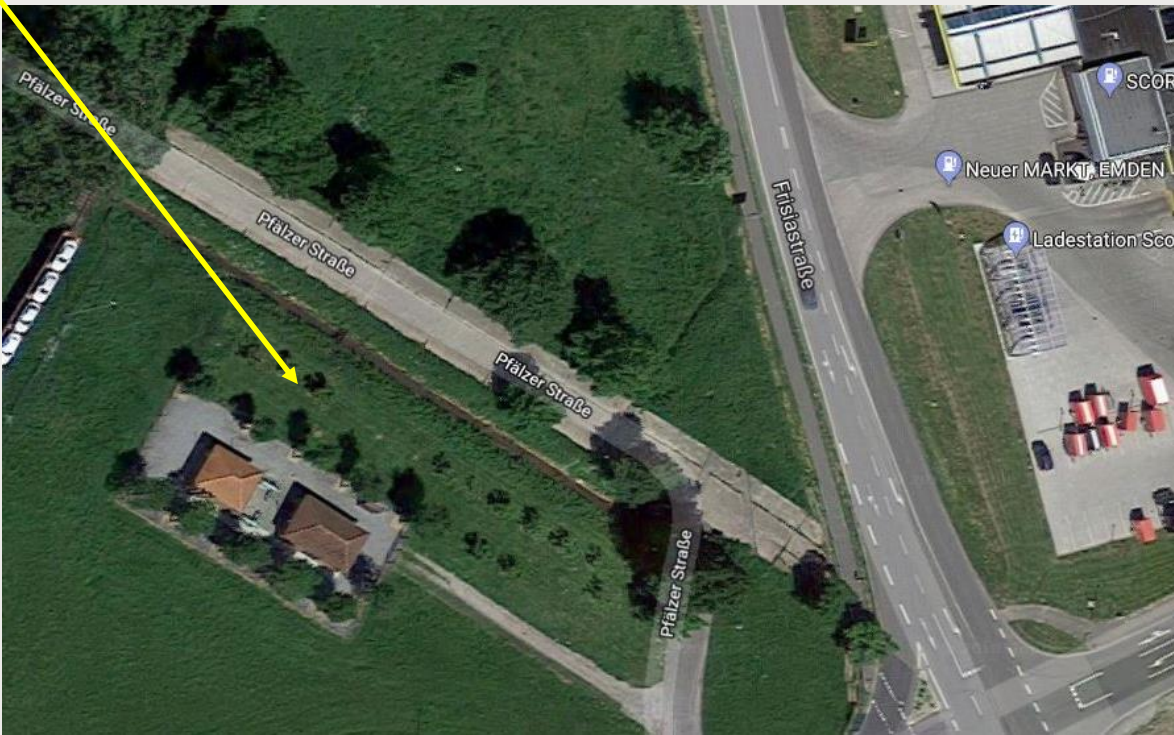

No relevant performance degradation during cycled operation

Dynamic response: Short Stack Testing at Full-scale (415 cm² active area)
20 bar, ~55 °C, 4 sets of cycles, total of 7500 cycles; Sets 1 & 2: 1530 cycles, Sets 3 & 4: 2220 cycles

PROJECT PROGRESS/ACTIONS – Setting-up field testing site

Emden, Germany

Location for the installation of the electrolyzer:
→ Pfälzer Straße, 26725 Emden

Control station

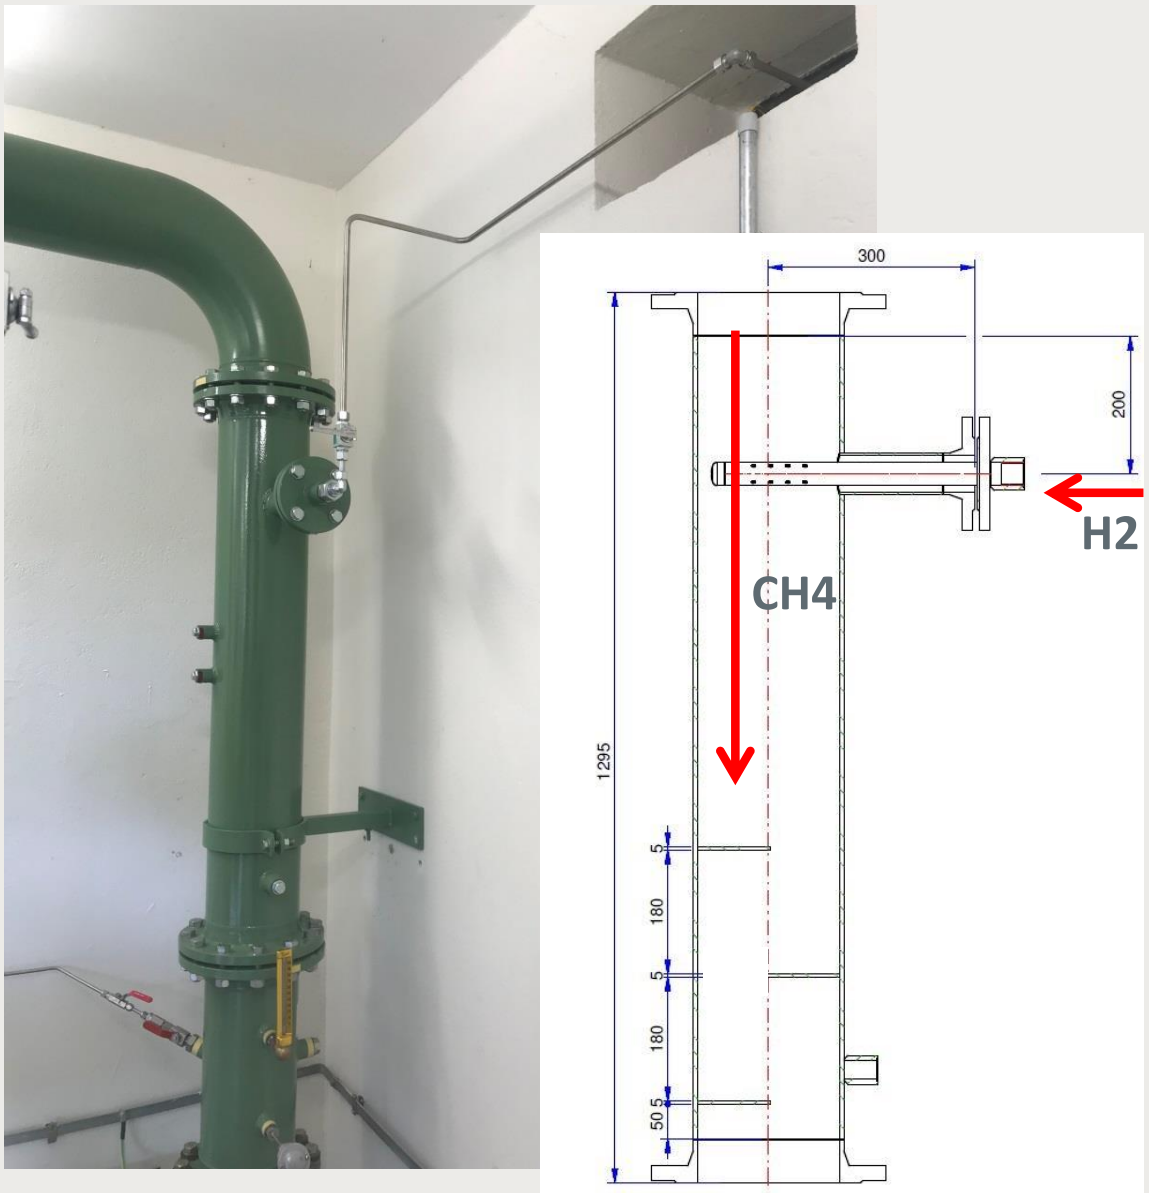

The pressure is reduced to 10 bar at the electrolysis system before the outlet

- ✓ After the check, the hydrogen leaves the control station and enters the gas transfer station
- ✓ Above-ground pipeline with a DN12 pipe

Hydrogen is fed into the natural gas grid

Mixer has built-in lamellas, so the gas mixture flow is turbulent
The gas grid is operated at 8.5 bar, the hydrogen is fed in with a slight overpressure of 10 bar

More information in the successive presentations

PROJECT PROGRESS/ACTIONS –

Installation of the PEM electrolyser in Emden for field testing activities

More information in the successive presentations

Progress in field testing

- ✓ Factory acceptance test was completed for the electrolysis system at ITM POWER in Sheffield (UK)
- ✓ The system was delivered to STADTWERKE EMDEN for field testing in Emden (Germany)
- ✓ Due to some previous delay in supplying of stack components and FAT, there is a shift of about 3 months in the overall planning
- ✓ Due to some limitations in maximum operating temperature for the ion exchange cartridges and the specific certification required for HT operation of some BoP components such valves, pipelines, pumps, the system can not be operated above 55-60°C
- ✓ This lower operating temperature represents a limitation for the achievement of the efficiency target that was planned taking into account operation at higher temperatures

EXPLOITATION PLAN/EXPECTED IMPACT

Exploitation plans of industrial partners (highlights):

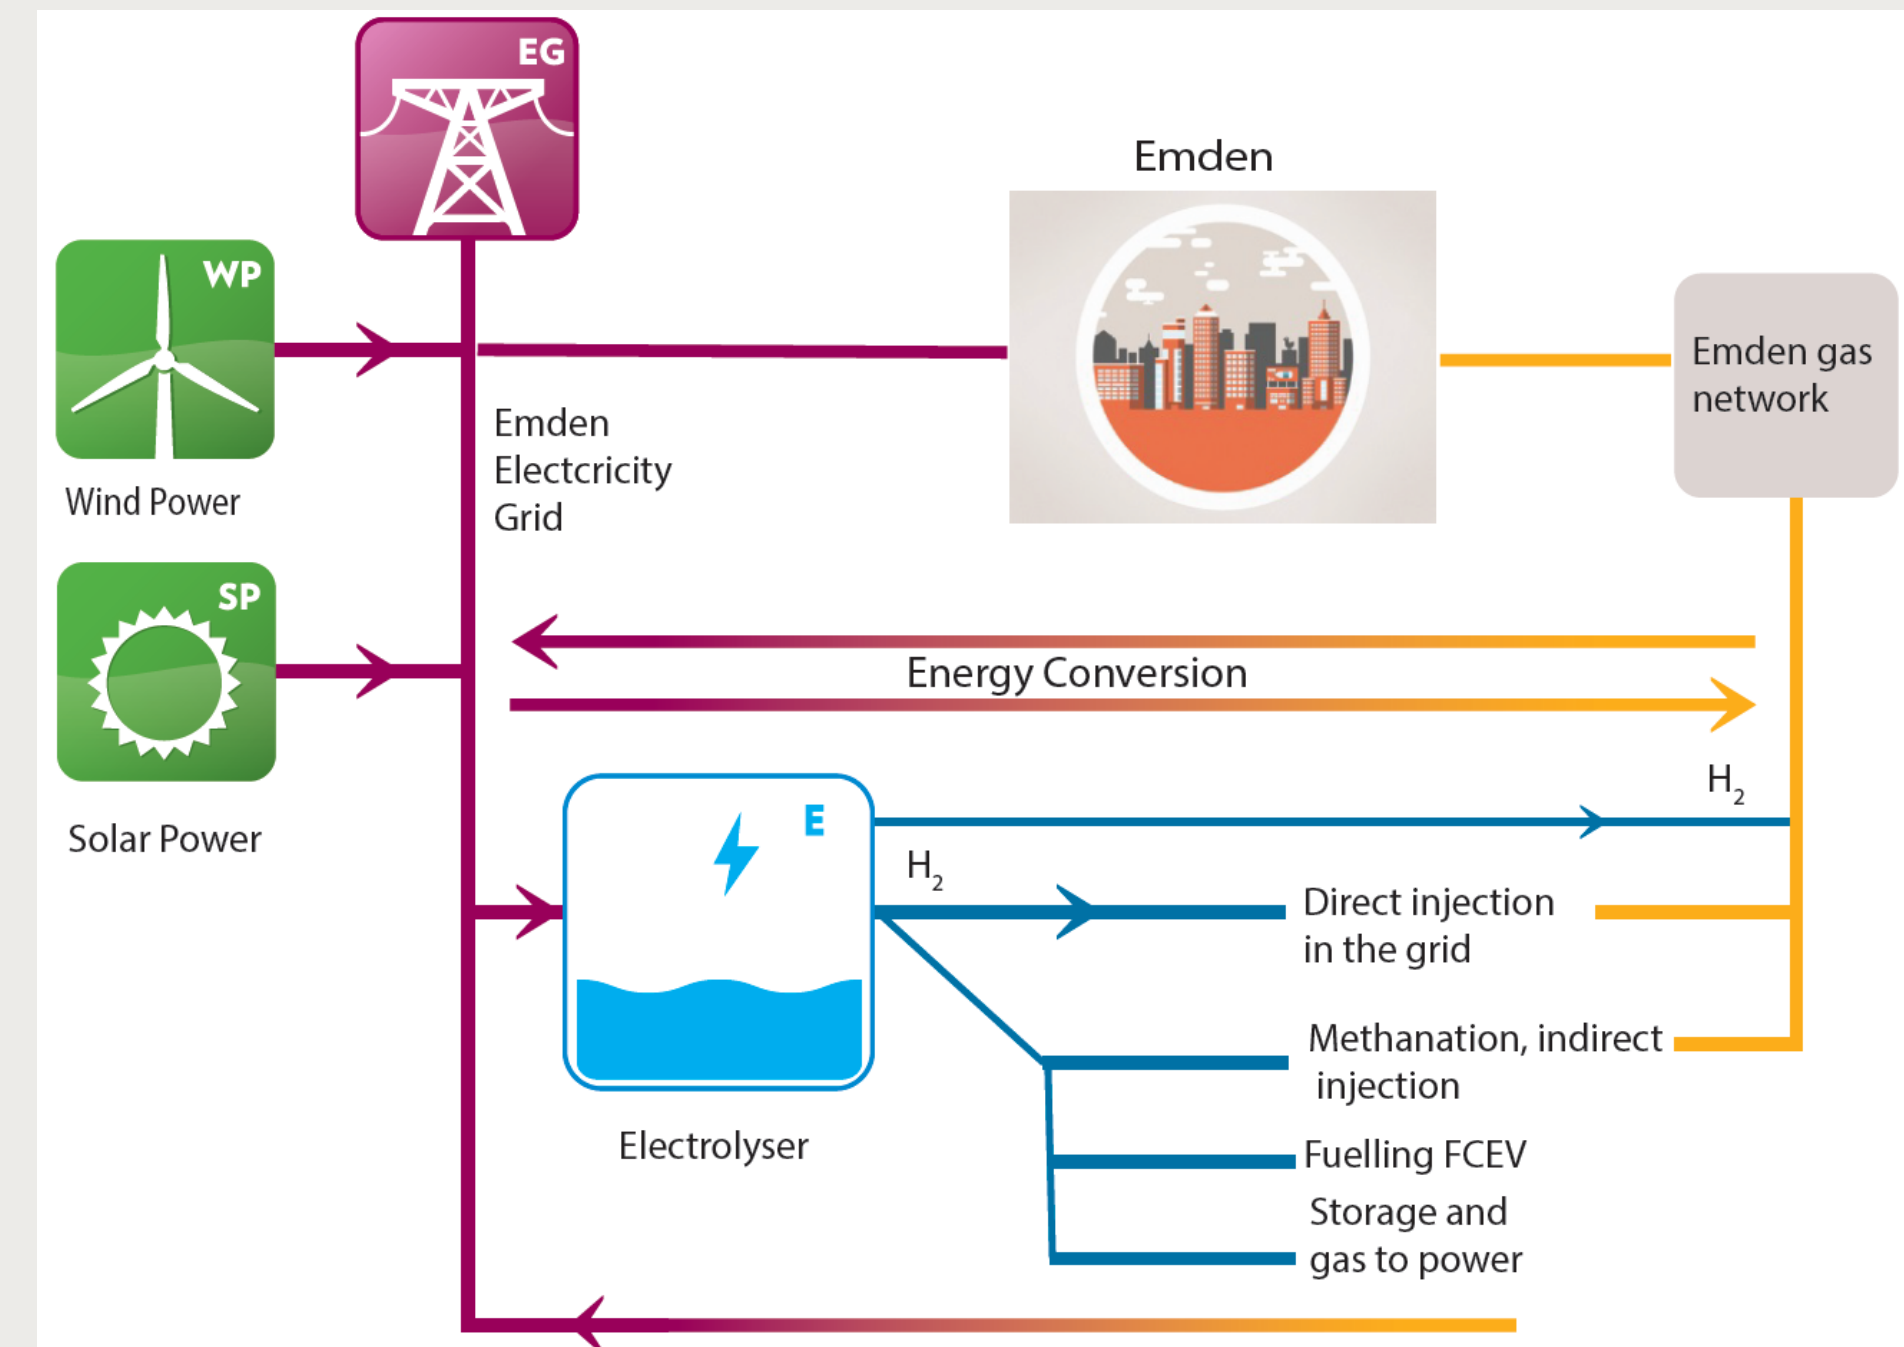

- ❖ **ITM** → new electrolyser system with increased operating current density (3 A cm^{-2}) and lower cost.
- ❖ **Solvay** → commercialisation of ionomer membranes for PEM water electrolysis application
- ❖ **IRD** → extending the portfolio of products for electrochemical systems and the development of components and MEAs for this application
- ❖ **SWE** → the results of the project will be used to implement renewable power sources with cost-competitive electrolysis plants for power-to-gas and especially as a means of storage of surplus energy.
- ❖ Demonstration of the PEM electrolyser for operation with grids sharing renewable power energy e.g. wind turbines in Emden, will also bring new knowledge that can be exploited by the consortium.

Impact

Expected project impact:

- ❖ sustainable hydrogen production which can meet an increasing share of the hydrogen demand for energy applications from carbon-free or lean energy sources.
- ❖ to carry materials research, technology development and to reduce the total life cycle costs related to present PEM electrolysers.

HPPEM2GAS project: High Performance PEM Electrolyzer for Cost-effective Grid Balancing Applications

Hydrogen is an alternative energy carrier mediating between energy distribution and renewables.

The HPPEM2GAS project will develop a low cost PEM electrolyser optimised for grid management through both stack and balance of plant innovations, culminating in a six month field test of an advanced 180 – 300 kW PEM electrolyser. The electrolyser developed will implement an advanced BoP and improved stack design and components. Several strategies are applied to lower the overall cost, thus enabling widespread utilization of the technology. These primarily concern an three-fold increase in current density (resulting in the proportional decrease in capital costs) whilst maintaining cutting edge efficiency, a material use minimisation approach in terms of reduced membrane thickness whilst keeping the gas cross-over low, and reducing the precious metal loading.

Facts & Figures

Full name: High Performance PEM Electrolyzer for Cost-effective Grid Balancing Applications
Acronym: HPPEM2GAS
Duration: 36 months
Start date: April 2016
Total budget: 2,65 ME
EC Funding: 2,5 ME

Introduction from the coordinator

Sustainable hydrogen generation by water electrolysis using renewable electrical energy is a very promising technology for the next energy system. Polymer electrolyte water electrolysis is characterized by excellent efficiency and appropriate dynamic characteristics for storing renewable energy in hydrogen. This can efficiently address the gap between intermittent renewable power production and grid demand while hydrogen can become the future energy vector.

Increase in hydrogen production rate - by ITM Power

ITM Power increases hydrogen production rate of its PEM Water Electrolyser three-fold observing negligible impact on degradation during laboratory stack testing

The large-scale deployment of wind power and solar energy sources will strongly contribute to the implementation of Europe's energy policies objectives *i.e.* to produce 65% of electricity from renewable energy sources by 2050 and to reduce CO₂ emissions linked to energy production by 50%. [Read more..](#)

PGM (precious group metal) amount in PEM catalyst layers - by EWII

One of the ambitious targets in HPPEM2Gas is to lower the amount of precious group metal (PGM) in the catalyst layers without jeopardizing good performance or durability. The specific target is to reduce the total PGM loadings down to 0.5 mg_{PGM}/cm² or below. Good results are obtained *e.g.* the cathode PGM loading has been reduced by a factor of five without significant loss of performance nor durability (Figure below). Furthermore, prolonged single cell test show encouraging low degradation rates in steady state test.

Calculated U_{act} @ 1 A/cm² [V]

After 8760 operation hours at nominal conditions

Single cell test at nominal pressure 5.05, 5.00
